Flask-api is a small API project for creating users and files (Microsoft Word and PDF). These files contain data about users registered in the project.

The project is developed in Python 3.7 and use next main libraries:

- : microframework.
- : SQL database engine.
- : simple and small ORM.
- : asynchronous task queue/job.
- : message broker.
- : web server, reverse proxy, etc.
- : Web Server Gateway Interface (WSGI) server implementation.
- : monitoring and administrating Celery clusters.
- : client/server system that allows its users to monitor and control a number of processes on UNIX-like operating systems.

---

CHAPTER  
ONE

---

## INSTALLATION

### 1.1 1. Linux packages

These packages are required for the project installation:

```
sudo add-apt-repository ppa:deadsnakes/ppa
sudo apt-get update
sudo apt-get install autoconf build-essential cmake libcap-dev libffi-dev libpcre3-dev
  ↳ librabbitmq-dev libreoffice-writer libtool libxml2-dev libxslt1-dev libxslt1.1 pkg-
  ↳ config magic nginx python3-distutils python3.7 python3.7-dev python3.7-venv rabbitmq-
  ↳ server uuid-dev uwsgi uwsgi-src
sudo reboot
```

### 1.2 2. RabbitMQ configuration

Required plugins for monitoring our brokers in Flower:

```
sudo rabbitmq-plugins enable rabbitmq_management
sudo service rabbitmq-server restart
```

### 1.3 3. Python dependencies

Install Python dependencies:

```
python3.7 -m venv venv
source venv/bin/activate
pip install -r requirements.txt --no-cache-dir
```

## 1.4 4. Domain configuration

Add local domain to our `/etc/hosts` file:

```
127.0.0.1 flask-api.prod
```

## 1.5 5. Environment configuration

Create a new `.env` file based on `.env.example` file.

## 1.6 6. uWSGI configuration

Create a new `uwsgi.ini` file based on `uwsgi.ini.example`.

`username` and `project_path` must to be filled with appropriate values.

`www-data` group must to be added to your user:

```
sudo usermod -a -G www-data username
```

## 1.7 7. Nginx configuration

Create a new `flask_api` file based on `docs/examples/flask_api.nginx.example` file.

Replace `uwsgi_pass` variable with the value in `socket` variable from `uwsgi.ini` file.

Move `flask_api` file to `/etc/nginx/sites-available` directory:

```
sudo mv docs/examples/flask_api /etc/nginx/sites-available
sudo ln -s /etc/nginx/sites-available/flask_api /etc/nginx/sites-enabled/flask_api
sudo systemctl restart nginx
```

## 1.8 8. Supervisor configuration

### 1.8.1 8.1 Main configuration

Create a new `supervisord.conf` file based on `docs/examples/supervisor/supervisord.conf.example` file in the root project.

`command`, `directory` and `username` variables must to be filled with appropriate values. These variables are below *Mr Developer* comment.

## 1.8.2 8.2 Other configurations

Create a new directory named *supervisor* in the root path and create next files based on *docs/examples/supervisor* example files:

1. celery.conf
2. flower.conf
3. uwsgi.conf

*username* and *path* variables must to be replaced with appropriate values.

## 1.9 9. Log directories

Create next log directories:

1. log/app
2. log/celery
3. log/flower
4. log/uwsgi

## 1.10 10. Supervisor systemd unit file

Create a new **flask\_api\_supervisor.service** file based on *docs/examples/flask\_api\_supervisor.service.example* file.

*username*, *usergroup* and *path* variables must to be filled with appropiate values.

Move file to */etc/systemd/system* directory and we run next commands:

```
sudo systemctl enable flask_api_supervisor.service
sudo systemctl daemon-reload
sudo systemctl start flask_api_supervisor.service
```

The systemd unit file start up the project if the system is reboot or shutdown.

For checking process status in command line:

```
sudo systemctl status flask_api_supervisor.service
```

For restart all processes in command line:

```
sudo systemctl restart flask_api_supervisor.service
```

This command reread the supervisor configuration files, stop all processes and start them again.

## 1.11 How to usage

The setup is finished, we only need to create the database tables and fill them with fake data. We open a terminal in the root project and run next commands:

```
./venv/bin/flask init-db  
./venv/bin/flask migrate  
./venv/bin/flask seed
```

You can use an API client such as Insomnia or Postman and starting to consume the API!

You can see the processes status here: <http://flask-api.prod/supervisor>

The credentials are user:123 by default, you can change the credentials in supervisord.conf file in *inet\_http\_server* section.

You can management the Celery tasks status here: <http://flask-api.prod:5555/flower/>

## 1.12 Optional installation

This project use for logging configuration. The config file is already defined you only need to do these steps:

1. Create new **flask\_api.logrotate** file based on *docs/examples/flask\_api.logrotate.example*.
2. *path*, *username* and *usergroup* variables must to be filled with appropiate values.
3. Move flask\_api\_logrotate to */etc/logrotate.d*:

```
sudo mv docs/examples/flask_api.logrotate /etc/logrotate.d
```

4. Restart logrotate service:

```
sudo service log rotate restart
```

A new log file will be created every day.

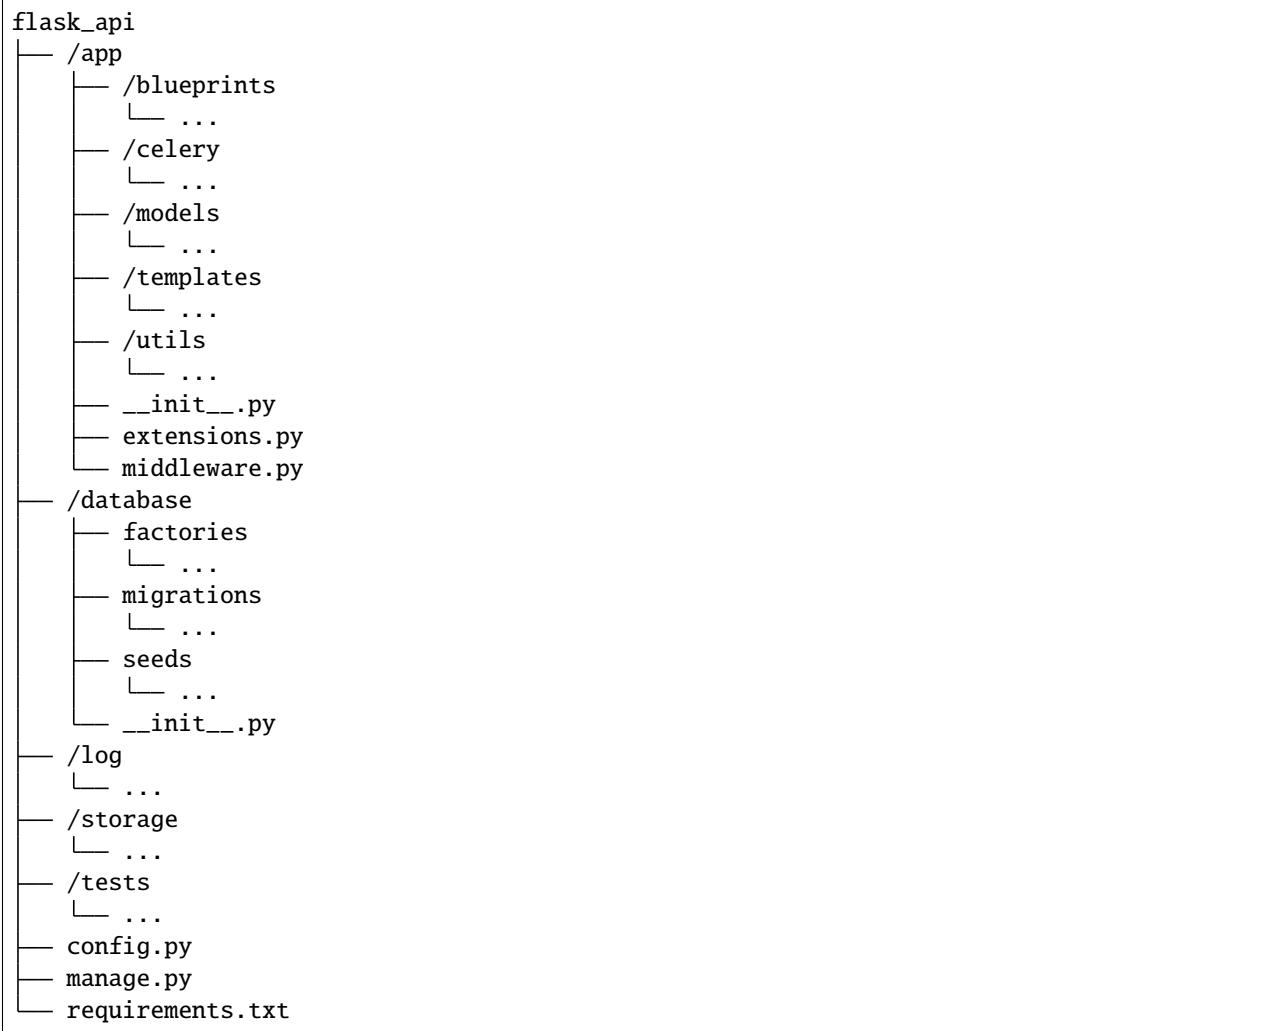

---

CHAPTER  
TWO

---

## SKELETON APP STRUCTURE

The project structure looks like this:

<code>app</code>	Package for building a Flask application.
<code>database</code>	Package for managing the database.
<code>tests</code>	Package for testing the application.
<code>config</code>	Module loads the application's configuration.

## 2.1 app

### Description

Package for building a Flask application.

The app package loads application configuration and registers middleware, blueprints, database models, etc.

### Modules

<code>app.blueprints</code>	Registers Flask blueprints.
<code>app.celery</code>	Runs Celery and registers Celery tasks.
<code>app.exceptions</code>	Module for managing exceptions.
<code>app.extensions</code>	Registers third party extensions.
<code>app.managers</code>	Registers database managers.
<code>app.middleware</code>	WSGI middleware for validating requests content type.
<code>app.models</code>	Registers database models.
<code>app.serializers</code>	Modules for managing data from requests and responses.
<code>app.services</code>	Registers services for managing business logic.
<code>app.swagger</code>	Models registered in Swagger.
<code>app.utils</code>	Collection of functions and classes which make common patterns shorter and easier.

### 2.1.1 app.blueprints

#### Description

Registers Flask blueprints.

#### Modules

<code>app.blueprints.auth</code>
<code>app.blueprints.base</code>
<code>app.blueprints.documents</code>
<code>app.blueprints.roles</code>
<code>app.blueprints.tasks</code>
<code>app.blueprints.users</code>

**app.blueprints.auth****Description****Classes**

---

`AuthBaseResource([api])`

---

`AuthUserLoginResource([api])`

---

`AuthUserLogoutResource([api])`

---

`RequestResetPasswordResource([api])`

---

`ResetPasswordResource([api])`

---

**app.blueprints.auth.AuthBaseResource**

```
class app.blueprints.auth.AuthBaseResource(api=None, *args, **kwargs)
Bases: flask_restx.resource.Resource
```

**Attributes**

---

`AuthBaseResource.auth_service`

---

<code>AuthBaseResource.decorators</code>	The canonical way to decorate class-based views is to decorate the return value of <code>as_view()</code> .
--	---

---

`AuthBaseResource.method_decorators`

---

<code>AuthBaseResource.methods</code>	A list of methods this view can handle.
---------------------------------------	---

---

<code>AuthBaseResource.provide_automatic_options</code>	Setting this disables or force-enables the automatic options handling.
---	--

---

`AuthBaseResource.representations`**app.blueprints.auth.AuthBaseResource.auth\_service**

```
AuthBaseResource.auth_service = <app.services.auth.AuthService object>
```

### `app.blueprints.auth.AuthBaseResource.decorators`

`AuthBaseResource.decorators: List[Callable] = []`

The canonical way to decorate class-based views is to decorate the return value of `as_view()`. However since this moves parts of the logic from the class declaration to the place where it's hooked into the routing system.

You can place one or more decorators in this list and whenever the view function is created the result is automatically decorated.

New in version 0.8.

### `app.blueprints.auth.AuthBaseResource.method_decorators`

`AuthBaseResource.method_decorators = []`

### `app.blueprints.auth.AuthBaseResource.methods`

`AuthBaseResource.methods: Optional[List[str]] = None`

A list of methods this view can handle.

### `app.blueprints.auth.AuthBaseResource.provide_automatic_options`

`AuthBaseResource.provide_automatic_options: Optional[bool] = None`

Setting this disables or force-enables the automatic options handling.

### `app.blueprints.auth.AuthBaseResource.representations`

`AuthBaseResource.representations = None`

## Methods

---

### `AuthBaseResource.__init__([api])`

<code>AuthBaseResource.as_view(name, *class_args, ...)</code>	Converts the class into an actual view function that can be used with the routing system.
<code>AuthBaseResource. dispatch_request(*args, ...)</code>	Subclasses have to override this method to im- plement the actual view function code.
<code>AuthBaseResource. validate_payload(func)</code>	Perform a payload validation on expected model if necessary

---

**app.blueprints.auth.AuthBaseResource.\_\_init\_\_**

```
AuthBaseResource.__init__(api=None, *args, **kwargs)
```

**app.blueprints.auth.AuthBaseResource.as\_view**

```
classmethod AuthBaseResource.as_view(name: str, *class_args: Any, **class_kwargs: Any) → Callable
```

Converts the class into an actual view function that can be used with the routing system. Internally this generates a function on the fly which will instantiate the View on each request and call the `dispatch_request()` method on it.

The arguments passed to `as_view()` are forwarded to the constructor of the class.

**app.blueprints.auth.AuthBaseResource.dispatch\_request**

```
AuthBaseResource.dispatch_request(*args, **kwargs)
```

Subclasses have to override this method to implement the actual view function code. This method is called with all the arguments from the URL rule.

**app.blueprints.auth.AuthBaseResource.validate\_payload**

```
AuthBaseResource.validate_payload(func)
```

Perform a payload validation on expected model if necessary

**app.blueprints.auth.AuthUserLoginResource**

```
class app.blueprints.auth.AuthUserLoginResource(api=None, *args, **kwargs)  
Bases: app.blueprints.auth.AuthBaseResource
```

**Attributes**

---

```
AuthUserLoginResource.auth_service
```

---

<code>AuthUserLoginResource.decorators</code>	The canonical way to decorate class-based views is to decorate the return value of <code>as_view()</code> .
---	---

---

```
AuthUserLoginResource.
```

```
method_decorators
```

```
AuthUserLoginResource.methods
```

A list of methods this view can handle.

```
AuthUserLoginResource.
```

```
provide_automatic_options
```

Setting this disables or force-enables the automatic options handling.

```
AuthUserLoginResource.
```

```
representations
```

**app.blueprints.auth.AuthUserLoginResource.auth\_service**

```
AuthUserLoginResource.auth_service = <app.services.auth.AuthService object>
```

**app.blueprints.auth.AuthUserLoginResource.decorators**

```
AuthUserLoginResource.decorators: List[Callable] = []
```

The canonical way to decorate class-based views is to decorate the return value of `as_view()`. However since this moves parts of the logic from the class declaration to the place where it's hooked into the routing system.

You can place one or more decorators in this list and whenever the view function is created the result is automatically decorated.

New in version 0.8.

**app.blueprints.auth.AuthUserLoginResource.method\_decorators**

```
AuthUserLoginResource.method_decorators = []
```

**app.blueprints.auth.AuthUserLoginResource.methods**

```
AuthUserLoginResource.methods: Optional[List[str]] = {'POST'}
```

A list of methods this view can handle.

**app.blueprints.auth.AuthUserLoginResource.provide\_automatic\_options**

```
AuthUserLoginResource.provide_automatic_options: Optional[bool] = None
```

Setting this disables or force-enables the automatic options handling.

**app.blueprints.auth.AuthUserLoginResource.representations**

```
AuthUserLoginResource.representations = None
```

## Methods

---

*AuthUserLoginResource.\_\_init\_\_([api])*

<i>AuthUserLoginResource.as_view(name, ...)</i>	Converts the class into an actual view function that can be used with the routing system.
---	---

<i>AuthUserLoginResource.dispatch_request(...)</i>	Subclasses have to override this method to implement the actual view function code.
--	---

<i>AuthUserLoginResource.post()</i>	
-------------------------------------	--

<i>AuthUserLoginResource.validate_payload(func)</i>	Perform a payload validation on expected model if necessary
---	---

**app.blueprints.auth.AuthUserLoginResource.\_\_init\_\_**

```
AuthUserLoginResource.__init__(api=None, *args, **kwargs)
```

**app.blueprints.auth.AuthUserLoginResource.as\_view**

```
classmethod AuthUserLoginResource.as_view(name: str, *class_args: Any,  
                                         **class_kwargs: Any) → Callable
```

Converts the class into an actual view function that can be used with the routing system. Internally this generates a function on the fly which will instantiate the View on each request and call the `dispatch_request()` method on it.

The arguments passed to `as_view()` are forwarded to the constructor of the class.

**app.blueprints.auth.AuthUserLoginResource.dispatch\_request**

```

### app.blueprints.auth.ResetPasswordResource.validate\_payload

```
ResetPasswordResource.validate_payload(func)
```

Perform a payload validation on expected model if necessary

```
class app.blueprints.auth.AuthBaseResource(api=None, *args, **kwargs)
```

```
classmethod as_view(name: str, *class_args: Any, **class_kwargs: Any) → Callable
```

Converts the class into an actual view function that can be used with the routing system. Internally this generates a function on the fly which will instantiate the `View` on each request and call the `dispatch_request()` method on it.

The arguments passed to `as_view()` are forwarded to the constructor of the class.

```
auth_service = <app.services.auth.AuthService object>
```

```
decorators: List[Callable] = []
```

The canonical way to decorate class-based views is to decorate the return value of `as_view()`. However since this moves parts of the logic from the class declaration to the place where it's hooked into the routing system.

You can place one or more decorators in this list and whenever the view function is created the result is automatically decorated.

New in version 0.8.

```
dispatch_request(*args, **kwargs)
```

Subclasses have to override this method to implement the actual view function code. This method is called with all the arguments from the URL rule.

```
method_decorators = []

**app.blueprints.documents.SearchDocumentResource.provide\_automatic\_options**

SearchDocumentResource.provide\_automatic\_options: Optional[bool] = None

Setting this disables or force-enables the automatic options handling.

**app.blueprints.documents.SearchDocumentResource.representations**

SearchDocumentResource.representations = None

**Methods**

---

<i>SearchDocumentResource. __init__(api)</i>	
<i>SearchDocumentResource.as_view(name, ...)</i>	Converts the class into an actual view function that can be used with the routing system.
<i>SearchDocumentResource. dispatch_request(...)</i>	Subclasses have to override this method to im- plement the actual view function code.
<i>SearchDocumentResource.post()</i>	
<i>SearchDocumentResource. validate_payload(func)</i>	Perform a payload validation on expected model if necessary

---

**app.blueprints.documents.SearchDocumentResource.\_\_init\_\_**

```
SearchDocumentResource.__init__(api=None, *args, **kwargs)
```

**app.blueprints.documents.SearchDocumentResource.as\_view**

```
classmethod SearchDocumentResource.as_view(name: str, *class_args: Any,  
                                         **class_kwargs: Any) → Callable
```

Converts the class into an actual view function that can be used with the routing system. Internally this generates a function on the fly which will instantiate the View on each request and call the `dispatch_request()` method on it.

The arguments passed to `as_view()` are forwarded to the constructor of the class.

**app.blueprints.documents.SearchDocumentResource.dispatch\_request**

```
SearchDocumentResource.dispatch_request(*args, **kwargs)
```

Subclasses have to override this method to implement the actual view function code. This method is called with all the arguments from the URL rule.

**app.blueprints.documents.SearchDocumentResource.post**

```
SearchDocumentResource.post() → tuple
```

**app.blueprints.documents.SearchDocumentResource.validate\_payload**

```
SearchDocumentResource.validate_payload(func)
```

Perform a payload validation on expected model if necessary

```
class app.blueprints.documents.DocumentBaseResource(api=None, *args, **kwargs)
```

```
classmethod as_view(name: str, *class_args: Any, **class_kwargs: Any) → Callable
```

Converts the class into an actual view function that can be used with the routing system. Internally this generates a function on the fly which will instantiate the View on each request and call the `dispatch_request()` method on it.

The arguments passed to `as_view()` are forwarded to the constructor of the class.

```
decorators: List[Callable] = []
```

The canonical way to decorate class-based views is to decorate the return value of `as_view()`. However since this moves parts of the logic from the class declaration to the place where it's hooked into the routing system.

You can place one or more decorators in this list and whenever the view function is created the result is automatically decorated.

New in version 0.8.

```
dispatch_request(*args, **kwargs)
```

Subclasses have to override this method to implement the actual view function code. This method is called with all the arguments from the URL rule.

```
doc_serializer = <DocumentSerializer(many=False)>
```

```
doc_service = <app.services.document.DocumentService object>

## app.blueprints.tasks.TaskResource

```
class app.blueprints.tasks.TaskResource(api=None, *args, **kwargs)
    Bases: flask_restx.resource.Resource
```

### Attributes

<i>TaskResource.decorators</i>	The canonical way to decorate class-based views is to decorate the return value of <code>as_view()</code> .
<i>TaskResource.method_decorators</i>	
<i>TaskResource.methods</i>	A list of methods this view can handle.
<i>TaskResource.provide_automatic_options</i>	Setting this disables or force-enables the automatic options handling.
<i>TaskResource.representations</i>	
<i>TaskResource.task_service</i>	

---

### app.blueprints.tasks.TaskResource.decorators

TaskResource.decorators: List[Callable] = []

The canonical way to decorate class-based views is to decorate the return value of as\_view(). However since this moves parts of the logic from the class declaration to the place where it's hooked into the routing system.

You can place one or more decorators in this list and whenever the view function is created the result is automatically decorated.

New in version 0.8.

### app.blueprints.tasks.TaskResource.method\_decorators

TaskResource.method\_decorators = []

### app.blueprints.tasks.TaskResource.methods

TaskResource.methods: Optional[List[str]] = None

A list of methods this view can handle.

### app.blueprints.tasks.TaskResource.provide\_automatic\_options

TaskResource.provide\_automatic\_options: Optional[bool] = None

Setting this disables or force-enables the automatic options handling.

### app.blueprints.tasks.TaskResource.representations

TaskResource.representations = None

### app.blueprints.tasks.TaskResource.task\_service

TaskResource.task\_service = <app.services.task.TaskService object>

## Methods

---

### TaskResource.\_\_init\_\_([api])

TaskResource.as_view(name, *class_args, ...)	Converts the class into an actual view function that can be used with the routing system.
TaskResource.dispatch_request(*args, **kwargs)	Subclasses have to override this method to implement the actual view function code.
TaskResource.validate_payload(func)	Perform a payload validation on expected model if necessary

**app.blueprints.tasks.TaskResource.\_\_init\_\_**

```
TaskResource.__init__(api=None, *args, **kwargs)
```

**app.blueprints.tasks.TaskResource.as\_view**

```
classmethod TaskResource.as_view(name: str, *class_args: Any, **class_kwargs: Any) → Callable
```

Converts the class into an actual view function that can be used with the routing system. Internally this generates a function on the fly which will instantiate the View on each request and call the `dispatch_request()` method on it.

The arguments passed to `as_view()` are forwarded to the constructor of the class.

**app.blueprints.tasks.TaskResource.dispatch\_request**

```
TaskResource.dispatch_request(*args, **kwargs)
```

Subclasses have to override this method to implement the actual view function code. This method is called with all the arguments from the URL rule.

**app.blueprints.tasks.TaskResource.validate\_payload**

```
TaskResource.validate_payload(func)
```

Perform a payload validation on expected model if necessary

**app.blueprints.tasks.TaskStatusResource**

```
class app.blueprints.tasks.TaskStatusResource(api=None, *args, **kwargs)  
Bases: app.blueprints.tasks.TaskResource
```

Setting this disables or force-enables the automatic options handling.

**app.blueprints.users.UserResource.representations****UserResource.representations:** `None`**app.blueprints.users.UserResource.task\_service****UserResource.task\_service:** `<app.services.task.TaskService object>`**app.blueprints.users.UserResource.user\_serializer****UserResource.user\_serializer:** `<UserSerializer(many=False)>`**app.blueprints.users.UserResource.user\_service****UserResource.user\_service:** `<app.services.user.UserService object>`

## Methods

---

`UserResource.__init__([api])`

---

`UserResource.as_view(name, *class_args, **class_kwargs)` Converts the class into an actual view function that can be used with the routing system.

---

`UserResource.delete(user_id)`

---

`UserResource.dispatch_request(*args, **kwargs)` Subclasses have to override this method to implement the actual view function code.

---

`UserResource.get(user_id)`

---

`UserResource.put(user_id)`

---

`UserResource.validate_payload(func)` Perform a payload validation on expected model if necessary

---

### app.blueprints.users.UserResource.\_\_init\_\_

`UserResource.__init__(api=None, *args, **kwargs)`

### app.blueprints.users.UserResource.as\_view

`classmethod UserResource.as_view(name: str, *class_args: Any, **class_kwargs: Any) → Callable`

Converts the class into an actual view function that can be used with the routing system. Internally this generates a function on the fly which will instantiate the View on each request and call the `dispatch_request()` method on it.

The arguments passed to `as_view()` are forwarded to the constructor of the class.

### app.blueprints.users.UserResource.delete

`UserResource.delete(user_id: int) → tuple`

### app.blueprints.users.UserResource.dispatch\_request

`UserResource.dispatch_request(*args, **kwargs)`

Subclasses have to override this method to implement the actual view function code. This method is called with all the arguments from the URL rule.

**app.blueprints.users.UserResource.get**

UserResource.get(*user\_id: int*) → tuple

**app.blueprints.users.UserResource.put**

UserResource.put(*user\_id: int*) → tuple

**app.blueprints.users.UserResource.validate\_payload**

UserResource.validate\_payload(*func*)

Perform a payload validation on expected model if necessary

**app.blueprints.users.UsersSearchResource**

class app.blueprints.users.UsersSearchResource(*api=None, \*args, \*\*kwargs*)

Bases: *app.blueprints.users.UserBaseResource*

`app.celery.excel.tasks`

---

## app.celery.excel.tasks

### Description

`app.celery.excel.tasks._add_excel_autofilter(worksheet: xlsxwriter.worksheet.Worksheet)`

`app.celery.excel.tasks._adjust_each_column_width(rows: list, worksheet: xlsxwriter.worksheet.Worksheet, excel_longest_word: int) → None`

`app.celery.excel.tasks._get_excel_column_names(excel_rows: list) → None`

`app.celery.excel.tasks._get_excel_user_data(users: list, excel_rows: list) → None`

`app.celery.excel.tasks._get_user_data(request_data: dict) → list`

`app.celery.excel.tasks._parse_user_data(users: list)`

`(task) app.celery.excel.tasks.export_user_data_in_excel_task(created_by: int, request_data: dict)`  
Proxy that evaluates object once.

Proxy will evaluate the object each time, while the promise will only evaluate it once.

## **flask\_api**

---

### **app.celery.tasks**

#### **Description**

**(task)**`app.celery.tasks.create_user_email_task(email_data) → bool`

Proxy that evaluates object once.

Proxy will evaluate the object each time, while the promise will only evaluate it once.

**(task)**`app.celery.tasks.create_word_and_excel_documents_task(created_by: int, request_data: dict, to_pdf: int) → bool`

Proxy that evaluates object once.

Proxy will evaluate the object each time, while the promise will only evaluate it once.

**(task)**`app.celery.tasks.reset_password_email_task(email_data) → bool`

Proxy that evaluates object once.

Proxy will evaluate the object each time, while the promise will only evaluate it once.

**(task)**`app.celery.tasks.send_email_with_attachments_task(task_data: list) → bool`

Proxy that evaluates object once.

Proxy will evaluate the object each time, while the promise will only evaluate it once.

### **app.celery.tests**

#### **Description**

#### **Modules**

---

##### **app.celery.tests.tasks**

---

### **app.celery.tests.tasks**

#### **Description**

**(task)**`app.celery.tests.tasks.create_task_table() → None`

Proxy that evaluates object once.

Proxy will evaluate the object each time, while the promise will only evaluate it once.

**(task)**`app.celery.tests.tasks.insert_task_record() → None`

Proxy that evaluates object once.

Proxy will evaluate the object each time, while the promise will only evaluate it once.

## app.celery.word

### Description

### Modules

---

`app.celery.word.tasks`

---

## app.celery.word.tasks

### Description

`app.celery.word.tasks._add_table_column_names(rows: list, original_column_names: set) → None`

`app.celery.word.tasks._add_table_user_data(users_query: list, rows: list) → None`

`app.celery.word.tasks._get_user_data(request_data: dict) → list`

`(task) app.celery.word.tasks.export_user_data_in_word_task(created_by: int, request_data: dict, to_pdf: int)`

Proxy that evaluates object once.

Proxy will evaluate the object each time, while the promise will only evaluate it once.

### Classes

---

`ContextTask()`

---

`MyCelery([main, loader, backend, amqp, ...])`

---

## app.celery.ContextTask

`class app.celery.ContextTask`  
Bases: `celery.app.task.Task`

### Attributes

<code>ContextTask.Request</code>	Request class used, or the qualified name of one.
<code>ContextTask.Strategy</code>	Execution strategy used, or the qualified name of one.
<code>ContextTask.abstract</code>	Deprecated attribute <code>abstract</code> here for compatibility.
<code>ContextTask.acks_late</code>	When enabled messages for this task will be acknowledged <code>after</code> the task has been executed, and not <i>just before</i> (the default behavior).

continues on next page

Table 64 – continued from previous page

<code>ContextTask.acks_on_failure_or_timeout</code>	When enabled messages for this task will be acknowledged even if it fails or times out.
<code>ContextTask.app</code>	
<code>ContextTask.backend</code>	
<code>ContextTask.default_retry_delay</code>	Default time in seconds before a retry of the task should be executed.
<code>ContextTask.expires</code>	Default task expiry time.
<code>ContextTask.from_config</code>	
<code>ContextTask.ignore_result</code>	If enabled the worker won't store task state and return values for this task. Defaults to the :setting:`task_ignore_result` setting.
<code>ContextTask.max_retries</code>	Maximum number of retries before giving up.
<code>ContextTask.name</code>	Name of the task.
<code>ContextTask.priority</code>	Default task priority.
<code>ContextTask.rate_limit</code>	None (no rate limit), '100/s' (hundred tasks a second), '100/m' (hundred tasks a minute), '100/h' (hundred tasks an hour)
<code>ContextTask.reject_on_worker_lost</code>	Even if <code>acks_late</code> is enabled, the worker will acknowledge tasks when the worker process executing them abruptly exits or is signaled (e.g., :sig:`KILL`/:sig:`INT`, etc).
<code>ContextTask.request</code>	Get current request object.
<code>ContextTask.request_stack</code>	Task request stack, the current request will be the topmost.
<code>ContextTask.resultrepr_maxsize</code>	Max length of result representation used in logs and events.
<code>ContextTask.send_events</code>	If enabled the worker will send monitoring events related to this task (but only if the worker is configured to send task related events).
<code>ContextTask.serializer</code>	The name of a serializer that are registered with <code>kombu.serialization.registry</code> .
<code>ContextTask.soft_time_limit</code>	Soft time limit. Defaults to the :setting:`task_soft_time_limit` setting.
<code>ContextTask.store_eager_result</code>	
<code>ContextTask.store_errors_even_if_ignored</code>	When enabled errors will be stored even if the task is otherwise configured to ignore results.
<code>ContextTaskthrows</code>	Tuple of expected exceptions.
<code>ContextTask.time_limit</code>	Hard time limit. Defaults to the :setting:`task_time_limit` setting.
<code>ContextTask.track_started</code>	If enabled the task will report its status as 'started' when the task is executed by a worker.
<code>ContextTask.trail</code>	If enabled the request will keep track of sub-tasks started by this task, and this information will be sent with the result ( <code>result.children</code> ).
<code>ContextTask.typing</code>	Enable argument checking.

**app.celery.ContextTask.Request**

**ContextTask.Request = 'celery.worker.request:Request'**  
Request class used, or the qualified name of one.

**app.celery.ContextTask.Strategy**

**ContextTask.Strategy = 'celery.worker.strategy:default'**  
Execution strategy used, or the qualified name of one.

**app.celery.ContextTask.abstract**

**ContextTask.abstract = True**  
Deprecated attribute abstract here for compatibility.

**app.celery.ContextTask.acks\_late**

**ContextTask.acks\_late = False**  
When enabled messages for this task will be acknowledged **after** the task has been executed, and not *just before* (the default behavior).

Please note that this means the task may be executed twice if the worker crashes mid execution.

The application default can be overridden with the :setting:`task\_acks\_late` setting.

**app.celery.ContextTask.acks\_on\_failure\_or\_timeout**

**ContextTask.acks\_on\_failure\_or\_timeout = True**  
When enabled messages for this task will be acknowledged even if it fails or times out.

Configuring this setting only applies to tasks that are acknowledged **after** they have been executed and only if :setting:`task\_acks\_late` is enabled.

The application default can be overridden with the :setting:`task\_acks\_on\_failure\_or\_timeout` setting.

**app.celery.ContextTask.app**

**ContextTask.app = <MyCelery \_\_main\_\_>**

**app.celery.ContextTask.backend**

**property ContextTask.backend**

**app.celery.ContextTask.default\_retry\_delay**

**ContextTask.default\_retry\_delay = 180**

Default time in seconds before a retry of the task should be executed. 3 minutes by default.

**app.celery.ContextTask.expires**

**ContextTask.expires = None**

Default task expiry time.

**app.celery.ContextTask.from\_config**

```
ContextTask.from_config = (('serializer', 'task_serializer'), ('rate_limit',  
    'task_default_rate_limit'), ('priority', 'task_default_priority'),  
    ('track_started', 'task_track_started'), ('acks_late', 'task_acks_late'),  
    ('acks_on_failure_or_timeout', 'task_acks_on_failure_or_timeout'),  
    ('reject_on_worker_lost', 'task_reject_on_worker_lost'), ('ignore_result',  
        'task_ignore_result'), ('store_eager_result', 'task_store_eager_result'),  
        ('store_errors_even_if_ignored', 'task_store_errors_even_if_ignored'))
```

**app.celery.ContextTask.ignore\_result**

**ContextTask.ignore\_result = False**

If enabled the worker won't store task state and return values for this task. Defaults to the :setting:`task\_ignore\_result` setting.

**app.celery.ContextTask.max\_retries**

**ContextTask.max\_retries = 3**

Maximum number of retries before giving up. If set to None, it will **never** stop retrying.

**app.celery.ContextTask.name**

**ContextTask.name = None**

Name of the task.

**app.celery.ContextTask.priority**

**ContextTask.priority = None**

Default task priority.

**app.celery.ContextTask.rate\_limit****ContextTask.rate\_limit = None**

None (no rate limit), '100/s' (hundred tasks a second), '100/m' (hundred tasks a minute), '100/h' (hundred tasks an hour)

**Type** Rate limit for this task type. Examples

**app.celery.ContextTask.reject\_on\_worker\_lost****ContextTask.reject\_on\_worker\_lost = None**

Even if `acks_late` is enabled, the worker will acknowledge tasks when the worker process executing them abruptly exits or is signaled (e.g., :sig:`KILL`/:sig:`INT`, etc).

Setting this to true allows the message to be re-queued instead, so that the task will execute again by the same worker, or another worker.

Warning: Enabling this can cause message loops; make sure you know what you're doing.

**app.celery.ContextTask.request****property ContextTask.request**

Get current request object.

**app.celery.ContextTask.request\_stack****ContextTask.request\_stack = <celery.utils.threads.\_LocalStack object>**

Task request stack, the current request will be the topmost.

**app.celery.ContextTask.resultrepr\_maxsize****ContextTask.resultrepr\_maxsize = 1024**

Max length of result representation used in logs and events.

**app.celery.ContextTask.send\_events****ContextTask.send\_events = True**

If enabled the worker will send monitoring events related to this task (but only if the worker is configured to send task related events). Note that this has no effect on the task-failure event case where a task is not registered (as it will have no task class to check this flag).

### `app.celery.ContextTask.serializer`

`ContextTask.serializer = 'json'`

The name of a serializer that are registered with `kombu.serialization.registry`. Default is `'json'`.

### `app.celery.ContextTask.soft_time_limit`

`ContextTask.soft_time_limit = None`

Soft time limit. Defaults to the `:setting:`task_soft_time_limit`` setting.

### `app.celery.ContextTask.store_eager_result`

`ContextTask.store_eager_result = False`

### `app.celery.ContextTask.store_errors_even_if_ignored`

`ContextTask.store_errors_even_if_ignored = False`

When enabled errors will be stored even if the task is otherwise configured to ignore results.

### `app.celery.ContextTask.throws`

`ContextTask.throws = ()`

Tuple of expected exceptions.

These are errors that are expected in normal operation and that shouldn't be regarded as a real error by the worker. Currently this means that the state will be updated to an error state, but the worker won't log the event as an error.

### `app.celery.ContextTask.time_limit`

`ContextTask.time_limit = None`

Hard time limit. Defaults to the `:setting:`task_time_limit`` setting.

### `app.celery.ContextTask.track_started`

`ContextTask.track_started = False`

If enabled the task will report its status as ‘started’ when the task is executed by a worker. Disabled by default as the normal behavior is to not report that level of granularity. Tasks are either pending, finished, or waiting to be retried.

Having a ‘started’ status can be useful for when there are long running tasks and there’s a need to report what task is currently running.

The application default can be overridden using the `:setting:`task_track_started`` setting.

**app.celery.ContextTask.trail****ContextTask.trail = True**

If enabled the request will keep track of subtasks started by this task, and this information will be sent with the result (`result.children`).

**app.celery.ContextTask.typing****ContextTask.typing = True**

Enable argument checking. You can set this to false if you don't want the signature to be checked when calling the task. Defaults to `app.strict_typing`.

**Methods**

---

<code>ContextTask.AsyncResult(task_id,</code>	GetAsyncResult instance for the specified task.
---	---

---

<code>**kwargs)</code>	
------------------------	--

---

<code>ContextTask.__init__()</code>	
-------------------------------------	--

---

<code>ContextTask.add_around(attr, around)</code>	
---	--

---

<code>ContextTask.add_to_chord(sig[, lazy])</code>	Add signature to the chord the current task is a member of.
--	---

---

<code>ContextTask.add_trail(result)</code>	
--	--

---

<code>ContextTask.after_return(status, retval,</code>	Handler called after the task returns.
<code>...)</code>	

---

<code>ContextTask.annotate()</code>	
-------------------------------------	--

---

<code>ContextTask.apply([args, kwargs, link, ...])</code>	Execute this task locally, by blocking until the task returns.
---	--

---

<code>ContextTask.apply_async([args, kwargs,</code>	Apply tasks asynchronously by sending a message.
<code>...])</code>	

---

<code>ContextTask.before_start(task_id, args,</code>	Handler called before the task starts.
<code>kwargs)</code>	

---

Table 65 – continued from previous page

<code>ContextTask.replace(sig)</code>	Replace this task, with a new task inheriting the task id.
<code>ContextTask.retry([args, kwargs, exc, ...])</code>	Retry the task, adding it to the back of the queue.
<code>ContextTask.run(*args, **kwargs)</code>	The body of the task executed by workers.
<code>ContextTask.s(*args, **kwargs)</code>	Create signature.
<code>ContextTask.send_event(type_[, retry, ...])</code>	Send monitoring event message.
<code>ContextTask.shadow_name(args, kwargs)</code>	Override for custom task name in worker logs/monitoring.
<code>ContextTask.si(*args, **kwargs)</code>	Create immutable signature.
<code>ContextTask.signature([args])</code>	Create signature.
<code>ContextTask.signature_from_request(...)</code>	
<code>ContextTask.starmap(it)</code>	Create a xstarmap task from it.
<code>ContextTask.start_strategy(app, consumer, ...)</code>	
<code>ContextTask.subtask([args])</code>	Create signature.
<code>ContextTask.subtask_from_request([request, ...])</code>	
<code>ContextTask.update_state([task_id, state, meta])</code>	Update task state.

### app.celery.ContextTask.AsyncResult

`ContextTaskAsyncResult(task_id, **kwargs)`

GetAsyncResult instance for the specified task.

**Parameters** `task_id` (`str`) – Task id to get result for.

### app.celery.ContextTask.\_\_init\_\_

`ContextTask.__init__()`

### app.celery.ContextTask.add\_around

`classmethod ContextTask.add_around(attr, around)`

### app.celery.ContextTask.add\_to\_chord

`ContextTask.add_to_chord(sig, lazy=False)`

Add signature to the chord the current task is a member of.

New in version 4.0.

Currently only supported by the Redis result backend.

**Parameters**

- `sig` (`Signature`) – Signature to extend chord with.
- `lazy` (`bool`) – If enabled the new task won't actually be called, and `sig.delay()` must be called manually.

**app.celery.ContextTask.add\_trail**

```
ContextTask.add_trail(result)
```

**app.celery.ContextTask.after\_return**

```
ContextTask.after_return(status, retval, task_id, args, kwargs, einfo)
```

Handler called after the task returns.

**Parameters**

- **status** (*str*) – Current task state.
- **retval** (*Any*) – Task return value/exception.
- **task\_id** (*str*) – Unique id of the task.
- **args** (*Tuple*) – Original arguments for the task.
- **kwargs** (*Dict*) – Original keyword arguments for the task.
- **einfo** (*ExceptionInfo*) – Exception information.

**Returns** The return value of this handler is ignored.

**Return type** None

**app.celery.ContextTask.annotate**

```
classmethod ContextTask.annotate()
```

**app.celery.ContextTask.apply**

```
ContextTask.apply(args=None, kwargs=None, link=None, link_error=None, task_id=None,  
retries=None, throw=None, logfile=None, loglevel=None, headers=None,  
**options)
```

Execute this task locally, by blocking until the task returns.

**Parameters**

- **args** (*Tuple*) – positional arguments passed on to the task.
- **kwargs** (*Dict*) – keyword arguments passed on to the task.
- **throw** (*bool*) – Re-raise task exceptions. Defaults to the **:setting:`task\_eager\_propagates`** setting.

**Returns** pre-evaluated result.

**Return type** celery.result.EagerResult

**app.celery.ContextTask.apply\_async**

```
ContextTask.apply_async(args=None, kwargs=None, task_id=None, producer=None,  
link=None, link_error=None, shadow=None, **options)
```

Apply tasks asynchronously by sending a message.

**Parameters**

- **args** (*Tuple*) – The positional arguments to pass on to the task.
- **kwargs** (*Dict*) – The keyword arguments to pass on to the task.
- **countdown** (*float*) – Number of seconds into the future that the task should execute. Defaults to immediate execution.
- **eta** (*datetime*) – Absolute time and date of when the task should be executed. May not be specified if *countdown* is also supplied.
- **expires** (*float, datetime*) – Datetime or seconds in the future for the task should expire. The task won't be executed after the expiration time.

- **shadow (str)** – Override task name used in logs/monitoring. Default is retrieved from `shadow_name()`.
- **connection (kombu.Connection)** – Re-use existing broker connection instead of acquiring one from the connection pool.
- **retry (bool)** – If enabled sending of the task message will be retried in the event of connection loss or failure. Default is taken from the `:setting:`task_publish_retry`` setting. Note that you need to handle the producer/connection manually for this to work.
- **retry\_policy (Mapping)** – Override the retry policy used. See the `:setting:`task_publish_retry_policy`` setting.
- **time\_limit (int)** – If set, overrides the default time limit.
- **soft\_time\_limit (int)** – If set, overrides the default soft time limit.
- **queue (str, kombu.Queue)** – The queue to route the task to. This must be a key present in `:setting:`task_queues``, or `:setting:`task_create_missing_queues`` must be enabled. See guide-routing for more information.
- **exchange (str, kombu.Exchange)** – Named custom exchange to send the task to. Usually not used in combination with the `queue` argument.
- **routing\_key (str)** – Custom routing key used to route the task to a worker server. If in combination with a `queue` argument only used to specify custom routing keys to topic exchanges.
- **priority (int)** – The task priority, a number between 0 and 9. Defaults to the `priority` attribute.
- **serializer (str)** – Serialization method to use. Can be `pickle`, `json`, `yaml`, `msgpack` or any custom serialization method that's been registered with `kombu.serialization.registry`. Defaults to the `serializer` attribute.
- **compression (str)** – Optional compression method to use. Can be one of `zlib`, `bzip2`, or any custom compression methods registered with `kombu.compression.register()`. Defaults to the `:setting:`task_compression`` setting.
- **link (Signature)** – A single, or a list of tasks signatures to apply if the task returns successfully.
- **link\_error (Signature)** – A single, or a list of task signatures to apply if an error occurs while executing the task.
- **producer (kombu.Producer)** – custom producer to use when publishing the task.
- **add\_to\_parent (bool)** – If set to `True` (default) and the task is applied while executing another task, then the result will be appended to the parent tasks `request.children` attribute. Trailing can also be disabled by default using the `trail` attribute
- **ignore\_result (bool)** – If set to `False` (default) the result of a task will be stored in the backend. If set to `True` the result will not be stored. This can also be set using the `ignore_result` in the `app.task` decorator.
- **publisher (kombu.Producer)** – Deprecated alias to `producer`.
- **headers (Dict)** – Message headers to be included in the message.

**Returns** Promise of future evaluation.

**Return type** celery.result.AsyncResult

**Raises**

- **TypeError** – If not enough arguments are passed, or too many arguments are passed. Note that signature checks may be disabled by specifying `@task(typing=False)`.
- **kombu.exceptions.OperationalError** – If a connection to the transport cannot be made, or if the connection is lost.

---

**Note:** Also supports all keyword arguments supported by `kombu.Producer.publish()`.

---

## app.celery.ContextTask.before\_start

ContextTask.**before\_start**(*task\_id*, *args*, *kwargs*)

Handler called before the task starts.

New in version 5.2.

### Parameters

- **task\_id** (*str*) – Unique id of the task to execute.
- **args** (*Tuple*) – Original arguments for the task to execute.
- **kwargs** (*Dict*) – Original keyword arguments for the task to execute.

**Returns** The return value of this handler is ignored.

**Return type** None

## app.celery.ContextTask.bind

**classmethod** ContextTask.**bind**(*app*)

## app.celery.ContextTask.chunks

ContextTask.**chunks**(*it*, *n*)

Create a chunks task for this task.

## app.celery.ContextTask.delay

ContextTask.**delay**(\**args*, \*\**kwargs*)

Star argument version of [\*apply\\_async\(\)\*](#).

Does not support the extra options enabled by [\*apply\\_async\(\)\*](#).

### Parameters

- **\*args** (*Any*) – Positional arguments passed on to the task.
- **\*\*kwargs** (*Any*) – Keyword arguments passed on to the task.

**Returns** Future promise.

**Return type** celery.result.AsyncResult

## app.celery.ContextTask.map

ContextTask.**map**(*it*)

Create a xmap task from *it*.

## app.celery.ContextTask.on\_bound

**classmethod** ContextTask.**on\_bound**(*app*)

Called when the task is bound to an app.

---

**Note:** This class method can be defined to do additional actions when the task class is bound to an app.

---

### `app.celery.ContextTask.on_failure`

`ContextTask.on_failure(exc, task_id, args, kwargs, einfo) → None`  
Error handler.

This is run by the worker when the task fails.

#### Parameters

- `exc (Exception)` – The exception raised by the task.
- `task_id (str)` – Unique id of the failed task.
- `args (Tuple)` – Original arguments for the task that failed.
- `kwargs (Dict)` – Original keyword arguments for the task that failed.
- `einfo (ExceptionInfo)` – Exception information.

**Returns** The return value of this handler is ignored.

**Return type** None

### `app.celery.ContextTask.on_retry`

`ContextTask.on_retry(exc, task_id, args, kwargs, einfo) → None`  
Retry handler.

This is run by the worker when the task is to be retried.

#### Parameters

- `exc (Exception)` – The exception sent to `retry()`.
- `task_id (str)` – Unique id of the retried task.
- `args (Tuple)` – Original arguments for the retried task.
- `kwargs (Dict)` – Original keyword arguments for the retried task.
- `einfo (ExceptionInfo)` – Exception information.

**Returns** The return value of this handler is ignored.

**Return type** None

### `app.celery.ContextTask.on_success`

`ContextTask.on_success(retval, task_id, args, kwargs) → None`  
Success handler.

Run by the worker if the task executes successfully.

#### Parameters

- `retval (Any)` – The return value of the task.
- `task_id (str)` – Unique id of the executed task.
- `args (Tuple)` – Original arguments for the executed task.
- `kwargs (Dict)` – Original keyword arguments for the executed task.

**Returns** The return value of this handler is ignored.

**Return type** None

**app.celery.ContextTask.pop\_request**`ContextTask.pop_request()`**app.celery.ContextTask.push\_request**`ContextTask.push_request(*args, **kwargs)`**app.celery.ContextTask.replace**`ContextTask.replace(sig)`

Replace this task, with a new task inheriting the task id.

Execution of the host task ends immediately and no subsequent statements will be run.

New in version 4.0.

**Parameters** `sig (Signature)` – signature to replace with.

**Raises**

- `~@Ignore` – This is always raised when called in asynchronous context.
- It is best to always use `return self.replace(...)` to convey –
- to the reader that the task won't continue after being replaced. –

**app.celery.ContextTask.retry**`ContextTask.retry(args=None, kwargs=None, exc=None, throw=True, eta=None, countdown=None, max_retries=None, **options)`

Retry the task, adding it to the back of the queue.

**Example**

```
>>> from imaginary_twitter_lib import Twitter
>>> from proj.celery import app
```

```
>>> @app.task(bind=True)
... def tweet(self, auth, message):
...     twitter = Twitter(oauth=auth)
...     try:
...         twitter.post_status_update(message)
...     except twitter.FailWhale as exc:
...         # Retry in 5 minutes.
...         self.retry(countdown=60 * 5, exc=exc)
```

---

**Note:** Although the task will never return above as `retry` raises an exception to notify the worker, we use `raise` in front of the retry to convey that the rest of the block won't be executed.

---

**Parameters**

- `args (Tuple)` – Positional arguments to retry with.
- `kwargs (Dict)` – Keyword arguments to retry with.

- **exc** (*Exception*) – Custom exception to report when the max retry limit has been exceeded (default: `@MaxRetriesExceededError`).

If this argument is set and `retry` is called while an exception was raised (`sys.exc_info()` is set) it will attempt to re-raise the current exception.

If no exception was raised it will raise the `exc` argument provided.

- **countdown** (*float*) – Time in seconds to delay the retry for.
- **eta** (*datetime*) – Explicit time and date to run the retry at.
- **max\_retries** (*int*) – If set, overrides the default retry limit for this execution. Changes to this parameter don't propagate to subsequent task retry attempts. A value of `None`, means "use the default", so if you want infinite retries you'd have to set the `max_retries` attribute of the task to `None` first.
- **time\_limit** (*int*) – If set, overrides the default time limit.
- **soft\_time\_limit** (*int*) – If set, overrides the default soft time limit.
- **throw** (*bool*) – If this is `False`, don't raise the `@Retry` exception, that tells the worker to mark the task as being retried. Note that this means the task will be marked as failed if the task raises an exception, or successful if it returns after the retry call.
- **\*\*options** (*Any*) – Extra options to pass on to `apply_async()`.

**Raises** `celery.exceptions.Retry` – To tell the worker that the task has been re-sent for retry. This always happens, unless the `throw` keyword argument has been explicitly set to `False`, and is considered normal operation.

### app.celery.ContextTask.run

`ContextTask.run(*args, **kwargs)`

The body of the task executed by workers.

### app.celery.ContextTask.s

`ContextTask.s(*args, **kwargs)`

Create signature.

Shortcut for `.s(*a, **k) -> .signature(a, k)`.

### app.celery.ContextTask.send\_event

`ContextTask.send_event(type_, retry=True, retry_policy=None, **fields)`

Send monitoring event message.

This can be used to add custom event types in `:pypi:`Flower`` and other monitors.

**Parameters** `type` (*str*) – Type of event, e.g. "task-failed".

#### Keyword Arguments

- **retry** (*bool*) – Retry sending the message if the connection is lost. Default is taken from the `:setting:`task_publish_retry`` setting.
- **retry\_policy** (*Mapping*) – Retry settings. Default is taken from the `:setting:`task_publish_retry_policy`` setting.
- **\*\*fields** (*Any*) – Map containing information about the event. Must be JSON serializable.

### app.celery.ContextTask.shadow\_name

ContextTask.**shadow\_name**(*args*, *kwargs*, *options*)

Override for custom task name in worker logs/monitoring.

#### Example

```
from celery.utils.imports import qualname

def shadow_name(task, args, kwargs, options):
    return qualname(args[0])

@app.task(shadow_name=shadow_name, serializer='pickle')
def apply_function_async(fun, *args, **kwargs):
    return fun(*args, **kwargs)
```

#### Parameters

- **args** (*Tuple*) – Task positional arguments.
- **kwargs** (*Dict*) – Task keyword arguments.
- **options** (*Dict*) – Task execution options.

### app.celery.ContextTask.si

ContextTask.**si**(\**args*, \*\**kwargs*)

Create immutable signature.

Shortcut for .si(\**a*, \*\**k*) -> .signature(*a*, *k*, immutable=True).

### app.celery.ContextTask.signature

ContextTask.**signature**(*args=None*, \**starargs*, \*\**starkwargs*)

Create signature.

#### Returns

**object for** this task, wrapping arguments and execution options for a single task invocation.

**Return type** signature

### app.celery.ContextTask.signature\_from\_request

ContextTask.**signature\_from\_request**(*request=None*, *args=None*, *kwargs=None*,  
*queue=None*, \*\**extra\_options*)

### app.celery.ContextTask.starmap

ContextTask.**starmap**(*it*)  
Create a xstarmap task from *it*.

### app.celery.ContextTask.start\_strategy

ContextTask.**start\_strategy**(*app*, *consumer*, *\*\*kwargs*)

### app.celery.ContextTask.subtask

ContextTask.**subtask**(*args=None*, *\*starargs*, *\*\*starkwargs*)  
Create signature.  
**Returns**  
object for this task, wrapping arguments and execution options for a single task invocation.  
**Return type** signature

### app.celery.ContextTask.subtask\_from\_request

ContextTask.**subtask\_from\_request**(*request=None*, *args=None*, *kwargs=None*, *queue=None*, *\*\*extra\_options*)

### app.celery.ContextTask.update\_state

ContextTask.**update\_state**(*task\_id=None*, *state=None*, *meta=None*, *\*\*kwargs*)  
Update task state.

#### Parameters

- **task\_id** (*str*) – Id of the task to update. Defaults to the id of the current task.
- **state** (*str*) – New state.
- **meta** (*Dict*) – State meta-data.

### app.celery.MyCelery

```
class app.celery.MyCelery(main=None, loader=None, backend=None, amqp=None, events=None, log=None,
                           control=None, set_as_current=True, tasks=None, broker=None, include=None,
                           changes=None, config_source=None, fixups=None, task_cls=None,
                           autofinalize=True, namespace=None, strict_typing=True, **kwargs)
```

Bases: celery.app.base.Celery

## Attributes

<code>MyCelery.AsyncResult</code>	Create new result instance.
<code>MyCelery.Beat</code>	<b>celery beat</b> scheduler application.
<code>MyCelery.GroupResult</code>	Create new group result instance.
<code>MyCelery.IS_WINDOWS</code>	
<code>MyCelery.IS_macOS</code>	
<code>MyCelery.ResultSet</code>	
<code>MyCelery.SYSTEM</code>	
<code>MyCelery.Task</code>	Base task class for this app.
<code>MyCelery.WorkController</code>	Embeddable worker.
<code>MyCelery.Worker</code>	Worker application.
<code>MyCelery.amqp</code>	@amqp.
<code>MyCelery.amqp_cls</code>	
<code>MyCelery.annotations</code>	
<code>MyCelery.backend</code>	Current backend instance.
<code>MyCelery.backend_cls</code>	
<code>MyCelery.builtin_fixups</code>	
<code>MyCelery.conf</code>	Current configuration.
<code>MyCelery.control</code>	@control.
<code>MyCelery.control_cls</code>	
<code>MyCelery.current_task</code>	Instance of task being executed, or None.
<code>MyCelery.current_worker_task</code>	The task currently being executed by a worker or None.
<code>MyCelery.events</code>	@events.
<code>MyCelery.events_cls</code>	
<code>MyCelery.loader</code>	Current loader instance.
<code>MyCelery.loader_cls</code>	
<code>MyCelery.log</code>	@log.
<code>MyCelery.log_cls</code>	
<code>MyCelery.main</code>	Name of the <code>__main__</code> module.
<code>MyCelery.oid</code>	Universally unique identifier for this app.
<code>MyCelery.on_after_configure</code>	Signal sent after app has prepared the configuration.
<code>MyCelery.on_after_finalize</code>	Signal sent after app has been finalized.
<code>MyCelery.on_after_fork</code>	Signal sent by every new process after fork.
<code>MyCelery.on_configure</code>	Signal sent when app is loading configuration.
<code>MyCelery.pool</code>	@pool.

continues on next page

Table 66 – continued from previous page

<i>MyCelery.producer_pool</i>	
<i>MyCelery.registry_cls</i>	
<i>MyCelery.steps</i>	Custom bootsteps to extend and modify the worker.
<i>MyCelery.task_cls</i>	
<i>MyCelery.tasks</i>	Task registry.
<i>MyCelery.thread_oid</i>	Per-thread unique identifier for this app.
<i>MyCelery.timezone</i>	Current timezone for this app.
<i>MyCelery.user_options</i>	Custom options for command-line programs.

### **app.celery.MyCelery.AsyncResult**

#### **MyCeleryAsyncResult**

Create new result instance.

**See also:**

`celery.result.AsyncResult`.

### **app.celery.MyCelery.Beat**

#### **MyCelery.Beat**

`celery beat` scheduler application.

**See also:**

`@Beat`.

### **app.celery.MyCelery.GroupResult**

#### **MyCelery.GroupResult**

Create new group result instance.

**See also:**

`celery.result.GroupResult`.

### **app.celery.MyCelery.IS\_WINDOWS**

`MyCelery.IS_WINDOWS = False`

**app.celery.MyCelery.IS\_macOS**

MyCelery.IS\_macOS = False

**app.celery.MyCelery.ResultSet**

MyCelery.ResultSet

**app.celery.MyCelery.SYSTEM**

MyCelery.SYSTEM = 'Linux'

**app.celery.MyCelery.Task**

MyCelery.Task

Base task class for this app.

**app.celery.MyCelery.WorkController**

MyCelery.WorkController

Embeddable worker.

**See also:**

@WorkController.

**app.celery.MyCelery.Worker**

MyCelery.Worker

Worker application.

**See also:**

@Worker.

**app.celery.MyCelery.amqp**

MyCelery.amqp

@amqp.

**Type** AMQP related functionality

**app.celery.MyCelery.amqp\_cls**

```
MyCelery.amqp_cls = 'celery.app.amqp:AMQP'
```

**app.celery.MyCelery.annotations**

```
MyCelery.annotations
```

**app.celery.MyCelery.backend**

```
property MyCelery.backend
```

Current backend instance.

**app.celery.MyCelery.backend\_cls**

```
MyCelery.backend_cls = None
```

**app.celery.MyCelery.builtin\_fixups**

```
MyCelery.builtin_fixups = {'celery.fixups.django:fixup'}
```

**app.celery.MyCelery.conf**

```
property MyCelery.conf
```

Current configuration.

**app.celery.MyCelery.control**

```
MyCelery.control
```

@control.

Type Remote control

**app.celery.MyCelery.control\_cls**

```
MyCelery.control_cls = 'celery.app.control:Control'
```

**app.celery.MyCelery.current\_task**

```
property MyCelery.current_task
```

Instance of task being executed, or None.

**app.celery.MyCelery.current\_worker\_task****property MyCelery.current\_worker\_task**

The task currently being executed by a worker or None.

Differs from `current_task` in that it's not affected by tasks calling other tasks directly, or eagerly.

**app.celery.MyCelery.events****MyCelery.events**

`@events.`

**Type** Consuming and sending events

**app.celery.MyCelery.events\_cls**

`MyCelery.events_cls = 'celery.app.events:Events'`

**app.celery.MyCelery.loader****MyCelery.loader**

Current loader instance.

**app.celery.MyCelery.loader\_cls**

`MyCelery.loader_cls = None`

**app.celery.MyCelery.log****MyCelery.log**

`@log.`

**Type** Logging

**app.celery.MyCelery.log\_cls**

`MyCelery.log_cls = 'celery.app.log:Logging'`

**app.celery.MyCelery.main****MyCelery.main = None**

Name of the `__main__` module. Required for standalone scripts.

If set this will be used instead of `__main__` when automatically generating task names.

**app.celery.MyCelery.oid**

**MyCelery.oid**

Universally unique identifier for this app.

**app.celery.MyCelery.on\_after\_configure**

**MyCelery.on\_after\_configure = None**

Signal sent after app has prepared the configuration.

**app.celery.MyCelery.on\_after\_finalize**

**MyCelery.on\_after\_finalize = None**

Signal sent after app has been finalized.

**app.celery.MyCelery.on\_after\_fork**

**MyCelery.on\_after\_fork = None**

Signal sent by every new process after fork.

**app.celery.MyCelery.on\_configure**

**MyCelery.on\_configure = None**

Signal sent when app is loading configuration.

**app.celery.MyCelery.pool**

**property MyCelery.pool**

@pool.

---

**Note:** This attribute is not related to the workers concurrency pool.

---

**Type** Broker connection pool

**app.celery.MyCelery.producer\_pool**

**property MyCelery.producer\_pool**

**app.celery.MyCelery.registry\_cls**

```
MyCelery.registry_cls = 'celery.app.registry:TaskRegistry'
```

**app.celery.MyCelery.steps**

```
MyCelery.steps = None
```

Custom bootsteps to extend and modify the worker. See extending-bootsteps.

**app.celery.MyCelery.task\_cls**

```
MyCelery.task_cls = 'celery.app.task:Task'
```

**app.celery.MyCelery.tasks**

```
MyCelery.tasks
```

Task registry.

**Warning:** Accessing this attribute will also auto-finalize the app.

**app.celery.MyCelery.thread\_oid**

```
property MyCelery.thread_oid
```

Per-thread unique identifier for this app.

**app.celery.MyCelery.timezone**

```
MyCelery.timezone
```

Current timezone for this app.

This is a cached property taking the time zone from the `:setting:`timezone`` setting.

**app.celery.MyCelery.user\_options**

```
MyCelery.user_options = None
```

Custom options for command-line programs. See extending-commandoptions

**Methods**

<code>MyCelery.__init__([main, loader, backend, ...])</code>	
<code>MyCelery.add_defaults(fun)</code>	Add default configuration from dict d.
<code>MyCelery.add_periodic_task(schedule, sig[, ...])</code>	
<code>MyCelery.autodiscover_tasks([packages, ...])</code>	Auto-discover task modules.
<code>MyCelery.broker_connection([hostname, ...])</code>	Establish a connection to the message broker.
<code>MyCelery.bugreport()</code>	Return information useful in bug reports.
<code>MyCelery.close()</code>	Clean up after the application.
<code>MyCelery.config_from_cmdline(argv[, namespace])</code>	
<code>MyCelery.config_from_envvar(variable_name[, ...])</code>	Read configuration from environment variable.
<code>MyCelery.config_from_object(obj[, silent, ...])</code>	Read configuration from object.
<code>MyCelery.connection([hostname, userid, ...])</code>	Establish a connection to the message broker.
<code>MyCelery.connection_for_read([url])</code>	Establish connection used for consuming.
<code>MyCelery.connection_for_write([url])</code>	Establish connection used for producing.
<code>MyCelery.connection_or_acquire([connection])</code>	Context used to acquire a connection from the pool.
<code>MyCelery.create_task_cls()</code>	Create a base task class bound to this app.
<code>MyCelery.default_connection([connection])</code>	Context used to acquire a connection from the pool.
<code>MyCelery.default_producer([producer])</code>	Context used to acquire a producer from the pool.
<code>MyCelery.either(default_key, *defaults)</code>	Get key from configuration or use default values.
<code>MyCelery.finalize([auto])</code>	Finalize the app.
<code>MyCelery.gen_task_name(name, module)</code>	New task default automatic naming.
<code>MyCelery.now()</code>	Return the current time and date as a datetime.
<code>MyCelery.on_init()</code>	Optional callback called at init.
<code>MyCelery.prepare_config(c)</code>	Prepare configuration before it is merged with the defaults.
<code>MyCelery.producer_or_acquire([producer])</code>	Context used to acquire a producer from the pool.
<code>MyCelery.register_task(task, **options)</code>	Utility for registering a task-based class.
<code>MyCelery.select_queues([queues])</code>	Select subset of queues.
<code>MyCelery.send_task(name[, args, kwargs, ...])</code>	Send task by name.
<code>MyCelery.set_current()</code>	Make this the current app for this thread.
<code>MyCelery.set_default()</code>	Make this the default app for all threads.
<code>MyCelery.setup_security([...])</code>	Setup the message-signing serializer.
<code>MyCelery.signature(*args, **kwargs)</code>	Return a new <code>Signature</code> bound to this app.
<code>MyCelery.start([argv])</code>	Run <code>celery</code> using <code>argv</code> .
<code>MyCelery.subclass_with_self(Class[, name, ...])</code>	Subclass an app-compatible class.

continues on next page

Table 67 – continued from previous page

<code>MyCelery.task(*args, **opts)</code>	Decorator to create a task class out of any callable.
<code>MyCelery.uses_utc_timezone()</code>	Check if the application uses the UTC time-zone.
<code>MyCelery.worker_main(argv)</code>	Run <b>celery worker</b> using <i>argv</i> .

**app.celery.MyCelery.\_\_init\_\_**

```
MyCelery.__init__(main=None, loader=None, backend=None, amqp=None, events=None,
                  log=None, control=None, set_as_current=True, tasks=None, broker=None,
                  include=None, changes=None, config_source=None, fixups=None,
                  task_cls=None, autofinalize=True, namespace=None, strict_typing=True,
                  **kwargs)
```

**app.celery.MyCelery.add\_defaults**

`MyCelery.add_defaults(fun)`

Add default configuration from dict d.

If the argument is a callable function then it will be regarded as a promise, and it won't be loaded until the configuration is actually needed.

This method can be compared to:

```
>>> celery.conf.update(d)
```

with a difference that 1) no copy will be made and 2) the dict will not be transferred when the worker spawns child processes, so it's important that the same configuration happens at import time when pickle restores the object on the other side.

**app.celery.MyCelery.add\_periodic\_task**

```
MyCelery.add_periodic_task(schedule, sig, args=(), kwargs=(), name=None, **opts)
```

**app.celery.MyCelery.autodiscover\_tasks**

`MyCelery.autodiscover_tasks(packages=None, related_name='tasks', force=False)`

Auto-discover task modules.

Searches a list of packages for a “tasks.py” module (or use related\_name argument).

If the name is empty, this will be delegated to fix-ups (e.g., Django).

For example if you have a directory layout like this:

```
foo/__init__.py
    tasks.py
    models.py

bar/__init__.py
    tasks.py
```

(continues on next page)

(continued from previous page)

```
models.py  
baz/__init__.py  
models.py
```

Then calling `app.autodiscover_tasks(['foo', 'bar', 'baz'])` will result in the modules `foo.tasks` and `bar.tasks` being imported.

#### Parameters

- **packages** (*List[str]*) – List of packages to search. This argument may also be a callable, in which case the value returned is used (for lazy evaluation).
- **related\_name** (*Optional[str]*) – The name of the module to find. Defaults to “tasks”: meaning “look for ‘module.tasks’ for every module in packages.”. If `None` will only try to import the package, i.e. “look for ‘module’”.
- **force** (*bool*) – By default this call is lazy so that the actual auto-discovery won’t happen until an application imports the default modules. Forcing will cause the auto-discovery to happen immediately.

## app.celery.MyCelery.broker\_connection

```
MyCelery.broker_connection(hostname=None, userid=None, password=None,  
                           virtual_host=None, port=None, ssl=None,  
                           connect_timeout=None, transport=None,  
                           transport_options=None, heartbeat=None,  
                           login_method=None, failover_strategy=None, **kwargs)
```

Establish a connection to the message broker.

Please use `connection_for_read()` and `connection_for_write()` instead, to convey the intent of use for this connection.

#### Parameters

- **url** – Either the URL or the hostname of the broker to use.
- **hostname** (*str*) – URL, Hostname/IP-address of the broker. If a URL is used, then the other argument below will be taken from the URL instead.
- **userid** (*str*) – Username to authenticate as.
- **password** (*str*) – Password to authenticate with
- **virtual\_host** (*str*) – Virtual host to use (domain).
- **port** (*int*) – Port to connect to.
- **ssl** (*bool, Dict*) – Defaults to the `:setting:`broker_use_ssl`` setting.
- **transport** (*str*) – defaults to the `:setting:`broker_transport`` setting.
- **transport\_options** (*Dict*) – Dictionary of transport specific options.
- **heartbeat** (*int*) – AMQP Heartbeat in seconds (pyamqp only).
- **login\_method** (*str*) – Custom login method to use (AMQP only).
- **failover\_strategy** (*str, Callable*) – Custom failover strategy.
- **\*\*kwargs** – Additional arguments to `kombu.Connection`.

**Returns** the lazy connection instance.

**Return type** `kombu.Connection`

### app.celery.MyCelery.bugreport

MyCelery.**bugreport()**

Return information useful in bug reports.

### app.celery.MyCelery.close

MyCelery.**close()**

Clean up after the application.

Only necessary for dynamically created apps, and you should probably use the `with` statement instead.

#### Example

```
>>> with Celery(set_as_current=False) as app:  
...     with app.connection_for_write() as conn:  
...         pass
```

### app.celery.MyCelery.config\_from\_cmdline

MyCelery.**config\_from\_cmdline(argv, namespace='celery')**

### app.celery.MyCelery.config\_from\_envvar

MyCelery.**config\_from\_envvar(variable\_name, silent=False, force=False)**

Read configuration from environment variable.

The value of the environment variable must be the name of a module to import.

#### Example

```
>>> os.environ['CELERY_CONFIG_MODULE'] = 'myapp.celeryconfig'  
>>> celery.config_from_envvar('CELERY_CONFIG_MODULE')
```

### app.celery.MyCelery.config\_from\_object

MyCelery.**config\_from\_object(obj, silent=False, force=False, namespace=None)**

Read configuration from object.

Object is either an actual object or the name of a module to import.

### Example

```
>>> celery.config_from_object('myapp.celeryconfig')
```

```
>>> from myapp import celeryconfig
>>> celery.config_from_object(celeryconfig)
```

#### Parameters

- **silent** (*bool*) – If true then import errors will be ignored.
- **force** (*bool*) – Force reading configuration immediately. By default the configuration will be read only when required.

## app.celery.MyCelery.connection

```
MyCelery.connection(hostname=None, userid=None, password=None, virtual_host=None,
                     port=None, ssl=None, connect_timeout=None, transport=None,
                     transport_options=None, heartbeat=None, login_method=None,
                     failover_strategy=None, **kwargs)
```

Establish a connection to the message broker.

Please use `connection_for_read()` and `connection_for_write()` instead, to convey the intent of use for this connection.

#### Parameters

- **url** – Either the URL or the hostname of the broker to use.
- **hostname** (*str*) – URL, Hostname/IP-address of the broker. If a URL is used, then the other argument below will be taken from the URL instead.
- **userid** (*str*) – Username to authenticate as.
- **password** (*str*) – Password to authenticate with
- **virtual\_host** (*str*) – Virtual host to use (domain).
- **port** (*int*) – Port to connect to.
- **ssl** (*bool, Dict*) – Defaults to the `:setting:`broker_use_ssl`` setting.
- **transport** (*str*) – defaults to the `:setting:`broker_transport`` setting.
- **transport\_options** (*Dict*) – Dictionary of transport specific options.
- **heartbeat** (*int*) – AMQP Heartbeat in seconds (pyamqp only).
- **login\_method** (*str*) – Custom login method to use (AMQP only).
- **failover\_strategy** (*str, Callable*) – Custom failover strategy.
- **\*\*kwargs** – Additional arguments to `kombu.Connection`.

**Returns** the lazy connection instance.

**Return type** `kombu.Connection`

## app.celery.MyCelery.connection\_for\_read

```
MyCelery.connection_for_read(url=None, **kwargs)
```

Establish connection used for consuming.

#### See also:

`connection()` for supported arguments.

### app.celery.MyCelery.connection\_for\_write

MyCelery.**connection\_for\_write**(url=None, \*\*kwargs)

Establish connection used for producing.

**See also:**

[connection\(\)](#) for supported arguments.

### app.celery.MyCelery.connection\_or\_acquire

MyCelery.**connection\_or\_acquire**(connection=None, pool=True, \*\_, \*\*\_\_)

Context used to acquire a connection from the pool.

For use within a `with` statement to get a connection from the pool if one is not already provided.

**Parameters** **connection** (`kombu.Connection`) – If not provided, a connection will be acquired from the connection pool.

### app.celery.MyCelery.create\_task\_cls

MyCelery.**create\_task\_cls**()

Create a base task class bound to this app.

### app.celery.MyCelery.default\_connection

MyCelery.**default\_connection**(connection=None, pool=True, \*\_, \*\*\_\_)

Context used to acquire a connection from the pool.

For use within a `with` statement to get a connection from the pool if one is not already provided.

**Parameters** **connection** (`kombu.Connection`) – If not provided, a connection will be acquired from the connection pool.

### app.celery.MyCelery.default\_producer

MyCelery.**default\_producer**(producer=None)

Context used to acquire a producer from the pool.

For use within a `with` statement to get a producer from the pool if one is not already provided

**Parameters** **producer** (`kombu.Producer`) – If not provided, a producer will be acquired from the producer pool.

### app.celery.MyCelery.either

MyCelery.**either**(default\_key, \*defaults)

Get key from configuration or use default values.

Fallback to the value of a configuration key if none of the `*values` are true.

### **app.celery.MyCelery.finalize**

**MyCelery.finalize(auto=False)**

Finalize the app.

This loads built-in tasks, evaluates pending task decorators, reads configuration, etc.

### **app.celery.MyCelery.gen\_task\_name**

**MyCelery.gen\_task\_name(name, module)**

New task default automatic naming.

The default gen\_task\_name method builds task names based on absolute imports, for example:

**project / \_\_init\_\_.py /moduleA/  
  / \_\_init\_\_.py /tasks.py**

**/moduleB/ / \_\_init\_\_.py /tasks.py**

The default automatic naming is “project.moduleA.tasks.taskA”, “project.moduleA.tasks.taskB”, etc. This new default automatic naming forget “tasks” in all task names:

DEFAULT WAY NEW WAY project.moduleA.tasks.taskA project.moduleA.taskA  
project.moduleA.tasks.taskA project.moduleA.taskB project.moduleB.tasks.taskA  
project.moduleB.taskA

This method is only used when the tasks don't have a name attribute defined, otherwise, the task name will be respect.

## **References**

[https://docs.celeryproject.org/en/stable/userguide/tasks.html?highlight=gen\\_task\\_name#changing-the-automatic-naming-behavior](https://docs.celeryproject.org/en/stable/userguide/tasks.html?highlight=gen_task_name#changing-the-automatic-naming-behavior)

### **app.celery.MyCelery.now**

**MyCelery.now()**

Return the current time and date as a datetime.

### **app.celery.MyCelery.on\_init**

**MyCelery.on\_init()**

Optional callback called at init.

### app.celery.MyCelery.prepare\_config

MyCelery.**prepare\_config**(*c*)

Prepare configuration before it is merged with the defaults.

### app.celery.MyCelery.producer\_or\_acquire

MyCelery.**producer\_or\_acquire**(*producer=None*)

Context used to acquire a producer from the pool.

For use within a `with` statement to get a producer from the pool if one is not already provided

**Parameters** **producer** (*kombu.Producer*) – If not provided, a producer will be acquired from the producer pool.

### app.celery.MyCelery.register\_task

MyCelery.**register\_task**(*task, \*\*options*)

Utility for registering a task-based class.

---

**Note:** This is here for compatibility with old Celery 1.0 style task classes, you should not need to use this for new projects.

---

### app.celery.MyCelery.select\_queues

MyCelery.**select\_queues**(*queues=None*)

Select subset of queues.

**Parameters** **queues** (*Sequence[str]*) – a list of queue names to keep.

### app.celery.MyCelery.send\_task

MyCelery.**send\_task**(*name, args=None, kwargs=None, countdown=None, eta=None, task\_id=None, producer=None, connection=None, router=None, result\_cls=None, expires=None, publisher=None, link=None, link\_error=None, add\_to\_parent=True, group\_id=None, group\_index=None, retries=0, chord=None, reply\_to=None, time\_limit=None, soft\_time\_limit=None, root\_id=None, parent\_id=None, route\_name=None, shadow=None, chain=None, task\_type=None, \*\*options*)

Send task by name.

Supports the same arguments as `@-Task.apply_async()`.

**Parameters**

- **name** (*str*) – Name of task to call (e.g., “`tasks.add`”).
- **result\_cls** (*AsyncResult*) – Specify custom result class.

### `app.celery.MyCelery.set_current`

`MyCelery.set_current()`

Make this the current app for this thread.

### `app.celery.MyCelery.set_default`

`MyCelery.set_default()`

Make this the default app for all threads.

### `app.celery.MyCelery.setup_security`

`MyCelery.setup_security(allowed_serializers=None, key=None, cert=None, store=None, digest='sha256', serializer='json')`

Setup the message-signing serializer.

This will affect all application instances (a global operation).

Disables untrusted serializers and if configured to use the auth serializer will register the auth serializer with the provided settings into the Kombu serializer registry.

#### Parameters

- **allowed\_serializers** (`Set[str]`) – List of serializer names, or content\_types that should be exempt from being disabled.
- **key** (`str`) – Name of private key file to use. Defaults to the `:setting:`security_key`` setting.
- **cert** (`str`) – Name of certificate file to use. Defaults to the `:setting:`security_certificate`` setting.
- **store** (`str`) – Directory containing certificates. Defaults to the `:setting:`security_cert_store`` setting.
- **digest** (`str`) – Digest algorithm used when signing messages. Default is sha256.
- **serializer** (`str`) – Serializer used to encode messages after they've been signed. See `:setting:`task_serializer`` for the serializers supported. Default is json.

### `app.celery.MyCelery.signature`

`MyCelery.signature(*args, **kwargs)`

Return a new Signature bound to this app.

### `app.celery.MyCelery.start`

`MyCelery.start(argv=None)`

Run `celery` using `argv`.

Uses `sys.argv` if `argv` is not specified.

## app.celery.MyCelery.subclass\_with\_self

```
MyCelery.subclass_with_self(Class, name=None, attribute='app', reverse=None,
                           keep_reduce=False, **kw)
```

Subclass an app-compatible class.

App-compatible means that the class has a class attribute that provides the default app it should use, for example: `class Foo: app = None`.

### Parameters

- **Class** (*type*) – The app-compatible class to subclass.
- **name** (*str*) – Custom name for the target class.
- **attribute** (*str*) – Name of the attribute holding the app, Default is ‘app’.
- **reverse** (*str*) – Reverse path to this object used for pickling purposes. For example, to get `app.AsyncResult`, use “AsyncResult”.
- **keep\_reduce** (*bool*) – If enabled a custom `__reduce__` implementation won’t be provided.

## app.celery.MyCelery.task

```
MyCelery.task(*args, **opts)
```

Decorator to create a task class out of any callable.

See Task options for a list of the arguments that can be passed to this decorator.

### Examples

```
@app.task
def refresh_feed(url):
    store_feed(feedparser.parse(url))
```

with setting extra options:

```
@app.task(exchange='feeds')
def refresh_feed(url):
    return store_feed(feedparser.parse(url))
```

---

**Note:** App Binding: For custom apps the task decorator will return a proxy object, so that the act of creating the task is not performed until the task is used or the task registry is accessed.

If you’re depending on binding to be deferred, then you must not access any attributes on the returned object until the application is fully set up (finalized).

---

### `app.celery.MyCelery.uses_utc_timezone`

`MyCelery.uses_utc_timezone()`

Check if the application uses the UTC timezone.

### `app.celery.MyCelery.worker_main`

`MyCelery.worker_main(argv=None)`

Run `celery worker` using `argv`.

Uses `sys.argv` if `argv` is not specified.

## Functions

---

### `make_celery(app)`

---

### `app.celery.make_celery`

`app.celery.make_celery(app: flask.app.Flask) → celery.app.base.Celery`

`class app.celery.ContextTask`

`AsyncResult(task_id, **kwargs)`

Get `AsyncResult` instance for the specified task.

`Parameters task_id (str) – Task id to get result for.`

`exception MaxRetriesExceededError(*args, **kwargs)`

The tasks max restart limit has been exceeded.

`args`

`with_traceback()`

`Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.`

`exception OperationalError`

Recoverable message transport connection error.

`args`

`with_traceback()`

`Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.`

`Request = 'celery.worker.request:Request'`

Request class used, or the qualified name of one.

`Strategy = 'celery.worker.strategy:default'`

Execution strategy used, or the qualified name of one.

`_app = <MyCelery __main__>`

The application instance associated with this task class.

`_backend = None`

**\_default\_request = None**

Some may expect a request to exist even if the task hasn't been called. This should probably be deprecated.

**\_exec\_options = None****classmethod \_get\_app()****\_get\_exec\_options()****\_get\_request()**

Get current request object.

**abstract = True**

Deprecated attribute `abstract` here for compatibility.

**acks\_late = False**

When enabled messages for this task will be acknowledged **after** the task has been executed, and not *just before* (the default behavior).

Please note that this means the task may be executed twice if the worker crashes mid execution.

The application default can be overridden with the `:setting:`task_acks_late`` setting.

**acks\_on\_failure\_or\_timeout = True**

When enabled messages for this task will be acknowledged even if it fails or times out.

Configuring this setting only applies to tasks that are acknowledged **after** they have been executed and only if `:setting:`task_acks_late`` is enabled.

The application default can be overridden with the `:setting:`task_acks_on_failure_or_timeout`` setting.

**classmethod add\_around(attr, around)****add\_to\_chord(sig, lazy=False)**

Add signature to the chord the current task is a member of.

New in version 4.0.

Currently only supported by the Redis result backend.

**Parameters**

- **sig** (*Signature*) – Signature to extend chord with.
- **lazy** (*bool*) – If enabled the new task won't actually be called, and `sig.delay()` must be called manually.

**add\_trail(result)****after\_return(status, retval, task\_id, args, kwargs, einfo)**

Handler called after the task returns.

**Parameters**

- **status** (*str*) – Current task state.
- **retval** (*Any*) – Task return value/exception.
- **task\_id** (*str*) – Unique id of the task.
- **args** (*Tuple*) – Original arguments for the task.
- **kwargs** (*Dict*) – Original keyword arguments for the task.
- **einfo** (*ExceptionInfo*) – Exception information.

**Returns** The return value of this handler is ignored.

**Return type** None

```
classmethod annotate()  
app = <MyCelery __main__>  
apply(args=None, kwargs=None, link=None, link_error=None, task_id=None, retries=None, throw=None,  
      logfile=None, loglevel=None, headers=None, **options)  
Execute this task locally, by blocking until the task returns.
```

#### Parameters

- **args** (*Tuple*) – positional arguments passed on to the task.
- **kwargs** (*Dict*) – keyword arguments passed on to the task.
- **throw** (*bool*) – Re-raise task exceptions. Defaults to the :setting:`task\_eager\_propagates` setting.

**Returns** pre-evaluated result.

**Return type** celery.result.EagerResult

```
apply_async(args=None, kwargs=None, task_id=None, producer=None, link=None, link_error=None,  
           shadow=None, **options)  
Apply tasks asynchronously by sending a message.
```

#### Parameters

- **args** (*Tuple*) – The positional arguments to pass on to the task.
- **kwargs** (*Dict*) – The keyword arguments to pass on to the task.
- **countdown** (*float*) – Number of seconds into the future that the task should execute. Defaults to immediate execution.
- **eta** (*datetime*) – Absolute time and date of when the task should be executed. May not be specified if *countdown* is also supplied.
- **expires** (*float, datetime*) – Datetime or seconds in the future for the task should expire. The task won't be executed after the expiration time.
- **shadow** (*str*) – Override task name used in logs/monitoring. Default is retrieved from *shadow\_name()*.
- **connection** (*kombu.Connection*) – Re-use existing broker connection instead of acquiring one from the connection pool.
- **retry** (*bool*) – If enabled sending of the task message will be retried in the event of connection loss or failure. Default is taken from the :setting:`task\_publish\_retry` setting. Note that you need to handle the producer/connection manually for this to work.
- **retry\_policy** (*Mapping*) – Override the retry policy used. See the :setting:`task\_publish\_retry\_policy` setting.
- **time\_limit** (*int*) – If set, overrides the default time limit.
- **soft\_time\_limit** (*int*) – If set, overrides the default soft time limit.
- **queue** (*str, kombu.Queue*) – The queue to route the task to. This must be a key present in :setting:`task\_queues`, or :setting:`task\_create\_missing\_queues` must be enabled. See guide-routing for more information.
- **exchange** (*str, kombu.Exchange*) – Named custom exchange to send the task to. Usually not used in combination with the *queue* argument.

- **routing\_key** (*str*) – Custom routing key used to route the task to a worker server. If in combination with a `queue` argument only used to specify custom routing keys to topic exchanges.
- **priority** (*int*) – The task priority, a number between 0 and 9. Defaults to the `priority` attribute.
- **serializer** (*str*) – Serialization method to use. Can be `pickle`, `json`, `yaml`, `msgpack` or any custom serialization method that's been registered with `kombu.serialization.registry`. Defaults to the `serializer` attribute.
- **compression** (*str*) – Optional compression method to use. Can be one of `zlib`, `bzip2`, or any custom compression methods registered with `kombu.compression.register()`. Defaults to the `:setting:`task_compression`` setting.
- **link** (*Signature*) – A single, or a list of tasks signatures to apply if the task returns successfully.
- **link\_error** (*Signature*) – A single, or a list of task signatures to apply if an error occurs while executing the task.
- **producer** (`kombu.Producer`) – custom producer to use when publishing the task.
- **add\_to\_parent** (*bool*) – If set to `True` (default) and the task is applied while executing another task, then the result will be appended to the parent tasks `request.children` attribute. Trailing can also be disabled by default using the `trail` attribute
- **ignore\_result** (*bool*) – If set to `False` (default) the result of a task will be stored in the backend. If set to `True` the result will not be stored. This can also be set using the `ignore_result` in the `app.task` decorator.
- **publisher** (`kombu.Producer`) – Deprecated alias to `producer`.
- **headers** (*Dict*) – Message headers to be included in the message.

**Returns** Promise of future evaluation.

**Return type** `celery.result.AsyncResult`

**Raises**

- **TypeError** – If not enough arguments are passed, or too many arguments are passed. Note that signature checks may be disabled by specifying `@task(typing=False)`.
- **`kombu.exceptions.OperationalError`** – If a connection to the transport cannot be made, or if the connection is lost.

---

**Note:** Also supports all keyword arguments supported by `kombu.Producer.publish()`.

---

### **property** `backend`

#### **before\_start**(*task\_id, args, kwargs*)

Handler called before the task starts.

New in version 5.2.

#### **Parameters**

- **task\_id** (*str*) – Unique id of the task to execute.
- **args** (*Tuple*) – Original arguments for the task to execute.
- **kwargs** (*Dict*) – Original keyword arguments for the task to execute.

**Returns** The return value of this handler is ignored.

**Return type** None

**classmethod** **bind**(*app*)

**chunks**(*it*, *n*)

Create a chunks task for this task.

**default\_retry\_delay = 180**

Default time in seconds before a retry of the task should be executed. 3 minutes by default.

**delay**(\**args*, \*\**kwargs*)

Star argument version of [apply\\_async\(\)](#).

Does not support the extra options enabled by [apply\\_async\(\)](#).

**Parameters**

- **\*args** (*Any*) – Positional arguments passed on to the task.

- **\*\*kwargs** (*Any*) – Keyword arguments passed on to the task.

**Returns** Future promise.

**Return type** celery.result.AsyncResult

**expires = None**

Default task expiry time.

```
from_config = (('serializer', 'task_serializer'), ('rate_limit',
'task_default_rate_limit'), ('priority', 'task_default_priority'), ('track_started',
'task_track_started'), ('acks_late', 'task_acks_late'),
('acks_on_failure_or_timeout', 'task_acks_on_failure_or_timeout'),
('reject_on_worker_lost', 'task_reject_on_worker_lost'), ('ignore_result',
'task_ignore_result'), ('store_eager_result', 'task_store_eager_result'),
('store_errors_even_if_ignored', 'task_store_errors_even_if_ignored'))
```

**ignore\_result = False**

If enabled the worker won't store task state and return values for this task. Defaults to the :setting:`task\_ignore\_result` setting.

**map**(*it*)

Create a xmap task from *it*.

**max\_retries = 3**

Maximum number of retries before giving up. If set to None, it will **never** stop retrying.

**name = None**

Name of the task.

**classmethod** **on\_bound**(*app*)

Called when the task is bound to an app.

---

**Note:** This class method can be defined to do additional actions when the task class is bound to an app.

---

**on\_failure**(*exc*, *task\_id*, *args*, *kwargs*, *einfo*) → None

Error handler.

This is run by the worker when the task fails.

**Parameters**

- **exc** (*Exception*) – The exception raised by the task.
- **task\_id** (*str*) – Unique id of the failed task.
- **args** (*Tuple*) – Original arguments for the task that failed.
- **kwargs** (*Dict*) – Original keyword arguments for the task that failed.
- **einfo** (*ExceptionInfo*) – Exception information.

**Returns** The return value of this handler is ignored.

**Return type** None

#### **on\_retry**(*exc, task\_id, args, kwargs, einfo*)

Retry handler.

This is run by the worker when the task is to be retried.

**Parameters**

- **exc** (*Exception*) – The exception sent to [retry\(\)](#).
- **task\_id** (*str*) – Unique id of the retried task.
- **args** (*Tuple*) – Original arguments for the retried task.
- **kwargs** (*Dict*) – Original keyword arguments for the retried task.
- **einfo** (*ExceptionInfo*) – Exception information.

**Returns** The return value of this handler is ignored.

**Return type** None

#### **on\_success**(*retval, task\_id, args, kwargs*)

Success handler.

Run by the worker if the task executes successfully.

**Parameters**

- **retval** (*Any*) – The return value of the task.
- **task\_id** (*str*) – Unique id of the executed task.
- **args** (*Tuple*) – Original arguments for the executed task.
- **kwargs** (*Dict*) – Original keyword arguments for the executed task.

**Returns** The return value of this handler is ignored.

**Return type** None

#### **pop\_request()**

#### **priority = None**

Default task priority.

#### **push\_request(\*args, \*\*kwargs)**

#### **rate\_limit = None**

None (no rate limit), ‘100/s’ (hundred tasks a second), ‘100/m’ (hundred tasks a minute), ‘100/h’ (hundred tasks an hour)

**Type** Rate limit for this task type. Examples

**reject\_on\_worker\_lost = None**

Even if `acks_late` is enabled, the worker will acknowledge tasks when the worker process executing them abruptly exits or is signaled (e.g., `:sig:`KILL`/:sig:`INT``, etc).

Setting this to true allows the message to be re-queued instead, so that the task will execute again by the same worker, or another worker.

Warning: Enabling this can cause message loops; make sure you know what you're doing.

**replace(sig)**

Replace this task, with a new task inheriting the task id.

Execution of the host task ends immediately and no subsequent statements will be run.

New in version 4.0.

**Parameters** `sig (Signature)` – signature to replace with.

**Raises**

- `~@Ignore` – This is always raised when called in asynchronous context.
- `It is best to always use return self.replace(...) to convey – to the reader that the task won't continue after being replaced.` –

**property request**

Get current request object.

**request\_stack = <celery.utils.threads.\_LocalStack object>**

Task request stack, the current request will be the topmost.

**resultrepr\_maxsize = 1024**

Max length of result representation used in logs and events.

**retry(args=None, kwargs=None, exc=None, throw=True, eta=None, countdown=None, max\_retries=None, \*\*options)**

Retry the task, adding it to the back of the queue.

**Example**

```
>>> from imaginary_twitter_lib import Twitter
>>> from proj.celery import app
```

```
>>> @app.task(bind=True)
... def tweet(self, auth, message):
...     twitter = Twitter(oauth=auth)
...     try:
...         twitter.post_status_update(message)
...     except twitter.FailWhale as exc:
...         # Retry in 5 minutes.
...         self.retry(countdown=60 * 5, exc=exc)
```

---

**Note:** Although the task will never return above as `retry` raises an exception to notify the worker, we use `raise` in front of the retry to convey that the rest of the block won't be executed.

---

**Parameters**

- **args** (*Tuple*) – Positional arguments to retry with.
- **kwargs** (*Dict*) – Keyword arguments to retry with.
- **exc** (*Exception*) – Custom exception to report when the max retry limit has been exceeded (default: `@MaxRetriesExceededError`).

If this argument is set and retry is called while an exception was raised (`sys.exc_info()` is set) it will attempt to re-raise the current exception.

If no exception was raised it will raise the `exc` argument provided.

- **countdown** (*float*) – Time in seconds to delay the retry for.
- **eta** (*datetime*) – Explicit time and date to run the retry at.
- **max\_retries** (*int*) – If set, overrides the default retry limit for this execution. Changes to this parameter don't propagate to subsequent task retry attempts. A value of `None`, means "use the default", so if you want infinite retries you'd have to set the `max_retries` attribute of the task to `None` first.
- **time\_limit** (*int*) – If set, overrides the default time limit.
- **soft\_time\_limit** (*int*) – If set, overrides the default soft time limit.
- **throw** (*bool*) – If this is `False`, don't raise the `@Retry` exception, that tells the worker to mark the task as being retried. Note that this means the task will be marked as failed if the task raises an exception, or successful if it returns after the retry call.
- **\*\*options** (*Any*) – Extra options to pass on to `apply_async()`.

**Raises** `celery.exceptions.Retry` – To tell the worker that the task has been re-sent for retry.

This always happens, unless the `throw` keyword argument has been explicitly set to `False`, and is considered normal operation.

**run(\*args, \*\*kwargs)**

The body of the task executed by workers.

**s(\*args, \*\*kwargs)**

Create signature.

Shortcut for `.s(*a, **k) -> .signature(a, k)`.

**send\_event(type\_, retry=True, retry\_policy=None, \*\*fields)**

Send monitoring event message.

This can be used to add custom event types in `:pypi:`Flower`` and other monitors.

**Parameters** `type` (*str*) – Type of event, e.g. "task-failed".

#### Keyword Arguments

- **retry** (*bool*) – Retry sending the message if the connection is lost. Default is taken from the `:setting:`task_publish_retry`` setting.
- **retry\_policy** (*Mapping*) – Retry settings. Default is taken from the `:setting:`task_publish_retry_policy`` setting.
- **\*\*fields** (*Any*) – Map containing information about the event. Must be JSON serializable.

**send\_events = True**

If enabled the worker will send monitoring events related to this task (but only if the worker is configured to send task related events). Note that this has no effect on the task-failure event case where a task is not registered (as it will have no task class to check this flag).

**serializer = 'json'**

The name of a serializer that are registered with `kombu.serialization.registry`. Default is `'json'`.

**shadow\_name(args, kwargs, options)**

Override for custom task name in worker logs/monitoring.

**Example**

```
from celery.utils.imports import qualname

def shadow_name(task, args, kwargs, options):
    return qualname(args[0])

@app.task(shadow_name=shadow_name, serializer='pickle')
def apply_function_async(fun, *args, **kwargs):
    return fun(*args, **kwargs)
```

**Parameters**

- **args** (*Tuple*) – Task positional arguments.
- **kwargs** (*Dict*) – Task keyword arguments.
- **options** (*Dict*) – Task execution options.

**si(\*args, \*\*kwargs)**

Create immutable signature.

Shortcut for `.si(*a, **k) -> .signature(a, k, immutable=True)`.

**signature(args=None, \*starargs, \*\*starkwargs)**

Create signature.

**Returns**

**object for** this task, wrapping arguments and execution options for a single task invocation.

**Return type** `signature`**signature\_from\_request(request=None, args=None, kwargs=None, queue=None, \*\*extra\_options)****soft\_time\_limit = None**

Soft time limit. Defaults to the `:setting:`task_soft_time_limit`` setting.

**starmap(it)**

Create a `xstarmap` task from `it`.

**start\_strategy(app, consumer, \*\*kwargs)****store\_eager\_result = False****store\_errors\_even\_if\_ignored = False**

When enabled errors will be stored even if the task is otherwise configured to ignore results.

**subtask(args=None, \*starargs, \*\*starkwargs)**

Create signature.

**Returns**

**object for** this task, wrapping arguments and execution options for a single task invocation.

**Return type** `signature`

```
subtask_from_request(request=None, args=None, kwargs=None, queue=None, **extra_options)
```

**throws = ()**

Tuple of expected exceptions.

These are errors that are expected in normal operation and that shouldn't be regarded as a real error by the worker. Currently this means that the state will be updated to an error state, but the worker won't log the event as an error.

**time\_limit = None**

Hard time limit. Defaults to the [:setting:`task\\_time\\_limit`](#) setting.

**track\_started = False**

If enabled the task will report its status as ‘started’ when the task is executed by a worker. Disabled by default as the normal behavior is to not report that level of granularity. Tasks are either pending, finished, or waiting to be retried.

Having a ‘started’ status can be useful for when there are long running tasks and there’s a need to report what task is currently running.

The application default can be overridden using the [:setting:`task\\_track\\_started`](#) setting.

**trail = True**

If enabled the request will keep track of subtasks started by this task, and this information will be sent with the result (`result.children`).

**typing = True**

Enable argument checking. You can set this to false if you don’t want the signature to be checked when calling the task. Defaults to `app.strict_typing`.

**update\_state(task\_id=None, state=None, meta=None, \*\*kwargs)**

Update task state.

**Parameters**

- **task\_id (str)** – Id of the task to update. Defaults to the id of the current task.
- **state (str)** – New state.
- **meta (Dict)** – State meta-data.

```
class app.celery.MyCelery(main=None, loader=None, backend=None, amqp=None, events=None, log=None,
                           control=None, set_as_current=True, tasks=None, broker=None, include=None,
                           changes=None, config_source=None, fixups=None, task_cls=None,
                           autofinalize=True, namespace=None, strict_typing=True, **kwargs)
```

**AsyncResult**

Create new result instance.

**See also:**

`celery.result.AsyncResult`.

**Beat**

`celery beat` scheduler application.

**See also:**

`@Beat`.

**GroupResult**

Create new group result instance.

See also:

`celery.result.GroupResult.`

`IS_WINDOWS = False`

`IS_macOS = False`

**Pickler**

alias of `celery.app.utils.AppPickler`

**ResultSet**

`SYSTEM = 'Linux'`

**Task**

Base task class for this app.

**WorkController**

Embeddable worker.

See also:

`@WorkController.`

**Worker**

Worker application.

See also:

`@Worker.`

`_acquire_connection(pool=True)`

Helper for `connection_or_acquire()`.

`_add_periodic_task(key, entry)`

`_after_fork()`

`_after_fork_registered = False`

`_autodiscover_tasks(packages, related_name, **kwargs)`

`_autodiscover_tasks_from_fixups(related_name)`

`_autodiscover_tasks_from_names(packages, related_name)`

`_canvas`

`_conf = None`

`_connection(url, userid=None, password=None, virtual_host=None, port=None, ssl=None, connect_timeout=None, transport=None, transport_options=None, heartbeat=None, login_method=None, failover_strategy=None, **kwargs)`

`_ensure_after_fork()`

`_finalize_pending_conf()`

Get config value by key and finalize loading the configuration.

---

Note:

This is used by PendingConfiguration: as soon as you access a key the configuration is read.

---

`_fixups = None`

```
_get_backend()
_get_default_loader()
_load_config()
_local = None
    Thread local storage.
_pool = None
_rgetattr(path)
_sig_to_periodic_task_entry(schedule, sig, args=(), kwargs=None, name=None, **opts)
_task_from_fun(fun, name=None, base=None, bind=False, **options)
add_defaults(fun)
    Add default configuration from dict d.
```

If the argument is a callable function then it will be regarded as a promise, and it won't be loaded until the configuration is actually needed.

This method can be compared to:

```
>>> celery.conf.update(d)
```

with a difference that 1) no copy will be made and 2) the dict will not be transferred when the worker spawns child processes, so it's important that the same configuration happens at import time when pickle restores the object on the other side.

```
add_periodic_task(schedule, sig, args=(), kwargs=(), name=None, **opts)
```

**amqp**

@amqp.

Type AMQP related functionality

```
amqp_cls = 'celery.app.amqp:AMQP'
```

**annotations**

```
autodiscover_tasks(packages=None, related_name='tasks', force=False)
```

Auto-discover task modules.

Searches a list of packages for a “tasks.py” module (or use related\_name argument).

If the name is empty, this will be delegated to fix-ups (e.g., Django).

For example if you have a directory layout like this:

```
foo/__init__.py
    tasks.py
    models.py

bar/__init__.py
    tasks.py
    models.py

baz/__init__.py
    models.py
```

Then calling `app.autodiscover_tasks(['foo', 'bar', 'baz'])` will result in the modules `foo.tasks` and `bar.tasks` being imported.

## Parameters

- **packages** (*List[str]*) – List of packages to search. This argument may also be a callable, in which case the value returned is used (for lazy evaluation).
- **related\_name** (*Optional[str]*) – The name of the module to find. Defaults to “tasks”: meaning “look for ‘module.tasks’ for every module in packages.”. If `None` will only try to import the package, i.e. “look for ‘module’”.
- **force** (*bool*) – By default this call is lazy so that the actual auto-discovery won’t happen until an application imports the default modules. Forcing will cause the auto-discovery to happen immediately.

### **property backend**

Current backend instance.

### **backend\_cls = None**

```
broker_connection(hostname=None, userid=None, password=None, virtual_host=None, port=None,
                  ssl=None, connect_timeout=None, transport=None, transport_options=None,
                  heartbeat=None, login_method=None, failover_strategy=None, **kwargs)
```

Establish a connection to the message broker.

Please use `connection_for_read()` and `connection_for_write()` instead, to convey the intent of use for this connection.

## Parameters

- **url** – Either the URL or the hostname of the broker to use.
- **hostname** (*str*) – URL, Hostname/IP-address of the broker. If a URL is used, then the other argument below will be taken from the URL instead.
- **userid** (*str*) – Username to authenticate as.
- **password** (*str*) – Password to authenticate with
- **virtual\_host** (*str*) – Virtual host to use (domain).
- **port** (*int*) – Port to connect to.
- **ssl** (*bool, Dict*) – Defaults to the `:setting:`broker_use_ssl`` setting.
- **transport** (*str*) – defaults to the `:setting:`broker_transport`` setting.
- **transport\_options** (*Dict*) – Dictionary of transport specific options.
- **heartbeat** (*int*) – AMQP Heartbeat in seconds (pyamqp only).
- **login\_method** (*str*) – Custom login method to use (AMQP only).
- **failover\_strategy** (*str, Callable*) – Custom failover strategy.
- **\*\*kwargs** – Additional arguments to `kombu.Connection`.

**Returns** the lazy connection instance.

**Return type** `kombu.Connection`

### **bugreport()**

Return information useful in bug reports.

### **builtin\_fixups = {'celery.fixups.djangoproject:fixup'}**

### **close()**

Clean up after the application.

Only necessary for dynamically created apps, and you should probably use the `with` statement instead.

### Example

```
>>> with Celery(set_as_current=False) as app:  
...     with app.connection_for_write() as conn:  
...         pass
```

#### property conf

Current configuration.

`config_from_cmdline(argv, namespace='celery')`

`config_from_envvar(variable_name, silent=False, force=False)`

Read configuration from environment variable.

The value of the environment variable must be the name of a module to import.

### Example

```
>>> os.environ['CELERY_CONFIG_MODULE'] = 'myapp.celeryconfig'  
>>> celery.config_from_envvar('CELERY_CONFIG_MODULE')
```

`config_from_object(obj, silent=False, force=False, namespace=None)`

Read configuration from object.

Object is either an actual object or the name of a module to import.

### Example

```
>>> celery.config_from_object('myapp.celeryconfig')
```

```
>>> from myapp import celeryconfig  
>>> celery.config_from_object(celeryconfig)
```

### Parameters

- `silent (bool)` – If true then import errors will be ignored.
- `force (bool)` – Force reading configuration immediately. By default the configuration will be read only when required.

`connection(hostname=None, userid=None, password=None, virtual_host=None, port=None, ssl=None, connect_timeout=None, transport=None, transport_options=None, heartbeat=None, login_method=None, failover_strategy=None, **kwargs)`

Establish a connection to the message broker.

Please use `connection_for_read()` and `connection_for_write()` instead, to convey the intent of use for this connection.

### Parameters

- `url` – Either the URL or the hostname of the broker to use.

- **hostname** (*str*) – URL, Hostname/IP-address of the broker. If a URL is used, then the other argument below will be taken from the URL instead.
- **userid** (*str*) – Username to authenticate as.
- **password** (*str*) – Password to authenticate with
- **virtual\_host** (*str*) – Virtual host to use (domain).
- **port** (*int*) – Port to connect to.
- **ssl** (*bool, Dict*) – Defaults to the `:setting:`broker_use_ssl`` setting.
- **transport** (*str*) – defaults to the `:setting:`broker_transport`` setting.
- **transport\_options** (*Dict*) – Dictionary of transport specific options.
- **heartbeat** (*int*) – AMQP Heartbeat in seconds (pyamqp only).
- **login\_method** (*str*) – Custom login method to use (AMQP only).
- **failover\_strategy** (*str, Callable*) – Custom failover strategy.
- **\*\*kwargs** – Additional arguments to `kombu.Connection`.

**Returns** the lazy connection instance.

**Return type** `kombu.Connection`

**connection\_for\_read**(*url=None, \*\*kwargs*)

Establish connection used for consuming.

**See also:**

`connection()` for supported arguments.

**connection\_for\_write**(*url=None, \*\*kwargs*)

Establish connection used for producing.

**See also:**

`connection()` for supported arguments.

**connection\_or\_acquire**(*connection=None, pool=True, \*\_, \*\*\_\_*)

Context used to acquire a connection from the pool.

For use within a `with` statement to get a connection from the pool if one is not already provided.

**Parameters** `connection(kombu.Connection)` – If not provided, a connection will be acquired from the connection pool.

**control**

`@control.`

**Type** Remote control

**control\_cls** = `'celery.app.control:Control'`

**create\_task\_cls()**

Create a base task class bound to this app.

**property current\_task**

Instance of task being executed, or `None`.

**property current\_worker\_task**

The task currently being executed by a worker or `None`.

Differs from `current_task` in that it's not affected by tasks calling other tasks directly, or eagerly.

**default\_connection**(connection=None, pool=True, \*\_, \*\*\_\_)

Context used to acquire a connection from the pool.

For use within a `with` statement to get a connection from the pool if one is not already provided.

**Parameters** `connection (kombu.Connection)` – If not provided, a connection will be acquired from the connection pool.

**default\_producer**(producer=None)

Context used to acquire a producer from the pool.

For use within a `with` statement to get a producer from the pool if one is not already provided

**Parameters** `producer (kombu.Producer)` – If not provided, a producer will be acquired from the producer pool.

**either**(default\_key, \*defaults)

Get key from configuration or use default values.

Fallback to the value of a configuration key if none of the `*values` are true.

**events**

@events.

**Type** Consuming and sending events

**events\_cls = 'celery.app.events:Events'****finalize**(auto=False)

Finalize the app.

This loads built-in tasks, evaluates pending task decorators, reads configuration, etc.

**gen\_task\_name**(name, module)

New task default automatic naming.

The default `gen_task_name` method builds task names based on absolute imports, for example:

`project / __init__.py /moduleA/`

`__init__.py /tasks.py`

`/moduleB/ __init__.py /tasks.py`

The default automatic naming is “`project.moduleA.tasks.taskA`”, “`project.moduleA.tasks.taskB`”, etc. This new default automatic naming forget “`tasks`” in all task names:

DEFAULT WAY NEW WAY `project.moduleA.tasks.taskA` `project.moduleA.taskA`  
`project.moduleA.tasks.taskA` `project.moduleA.taskB` `project.moduleB.tasks.taskA` `project.moduleB.taskA`

This method is only used when the tasks don’t have a name attribute defined, otherwise, the task name will be respect.

## References

[https://docs.celeryproject.org/en/stable/userguide/tasks.html?highlight=gen\\_task\\_name#changing-the-automatic-naming-behavior](https://docs.celeryproject.org/en/stable/userguide/tasks.html?highlight=gen_task_name#changing-the-automatic-naming-behavior)

### **loader**

Current loader instance.

### **loader\_cls = None**

### **log**

@log.

**Type** Logging

### **log\_cls = 'celery.app.log:Logging'**

### **main = None**

Name of the `__main__` module. Required for standalone scripts.

If set this will be used instead of `__main__` when automatically generating task names.

### **now()**

Return the current time and date as a datetime.

### **oid**

Universally unique identifier for this app.

### **on\_after\_configure = None**

Signal sent after app has prepared the configuration.

### **on\_after\_finalize = None**

Signal sent after app has been finalized.

### **on\_after\_fork = None**

Signal sent by every new process after fork.

### **on\_configure = None**

Signal sent when app is loading configuration.

### **on\_init()**

Optional callback called at init.

### **property pool**

@pool.

---

**Note:** This attribute is not related to the workers concurrency pool.

---

**Type** Broker connection pool

### **prepare\_config(c)**

Prepare configuration before it is merged with the defaults.

### **producer\_or\_acquire(producer=None)**

Context used to acquire a producer from the pool.

For use within a `with` statement to get a producer from the pool if one is not already provided

**Parameters** **producer** (`kombu.Producer`) – If not provided, a producer will be acquired from the producer pool.

### **property producer\_pool**

**register\_task(task, \*\*options)**

Utility for registering a task-based class.

---

**Note:** This is here for compatibility with old Celery 1.0 style task classes, you should not need to use this for new projects.

---

**registry\_cls = 'celery.app.registry:TaskRegistry'****select\_queues(queues=None)**

Select subset of queues.

**Parameters** **queues** (*Sequence[str]*) – a list of queue names to keep.

**send\_task(name, args=None, kwargs=None, countdown=None, eta=None, task\_id=None, producer=None, connection=None, router=None, result\_cls=None, expires=None, publisher=None, link=None, link\_error=None, add\_to\_parent=True, group\_id=None, group\_index=None, retries=0, chord=None, reply\_to=None, time\_limit=None, soft\_time\_limit=None, root\_id=None, parent\_id=None, route\_name=None, shadow=None, chain=None, task\_type=None, \*\*options)**

Send task by name.

Supports the same arguments as `@-Task.apply_async()`.

**Parameters**

- **name** (*str*) – Name of task to call (e.g., “`tasks.add`”).
- **result\_cls** (*AsyncResult*) – Specify custom result class.

**set\_current()**

Make this the current app for this thread.

**set\_default()**

Make this the default app for all threads.

**setup\_security(allowed\_serializers=None, key=None, cert=None, store=None, digest='sha256', serializer='json')**

Setup the message-signing serializer.

This will affect all application instances (a global operation).

Disables untrusted serializers and if configured to use the auth serializer will register the auth serializer with the provided settings into the Kombu serializer registry.

**Parameters**

- **allowed\_serializers** (*Set[str]*) – List of serializer names, or content\_types that should be exempt from being disabled.
- **key** (*str*) – Name of private key file to use. Defaults to the `:setting:`security_key`` setting.
- **cert** (*str*) – Name of certificate file to use. Defaults to the `:setting:`security_certificate`` setting.
- **store** (*str*) – Directory containing certificates. Defaults to the `:setting:`security_cert_store`` setting.
- **digest** (*str*) – Digest algorithm used when signing messages. Default is sha256.
- **serializer** (*str*) – Serializer used to encode messages after they’ve been signed. See `:setting:`task_serializer`` for the serializers supported. Default is json.

**signature(\*args, \*\*kwargs)**

Return a new Signature bound to this app.

**start(argv=None)**

Run **celery** using *argv*.

Uses `sys.argv` if *argv* is not specified.

**steps = None**

Custom bootsteps to extend and modify the worker. See [extending-bootsteps](#).

**subclass\_with\_self(Class, name=None, attribute='app', reverse=None, keep\_reduce=False, \*\*kw)**

Subclass an app-compatible class.

App-compatible means that the class has a `class` attribute that provides the default app it should use, for example: `class Foo: app = None`.

**Parameters**

- **Class (type)** – The app-compatible class to subclass.
- **name (str)** – Custom name for the target class.
- **attribute (str)** – Name of the attribute holding the app, Default is ‘app’.
- **reverse (str)** – Reverse path to this object used for pickling purposes. For example, to get `app.AsyncResult`, use “`AsyncResult`”.
- **keep\_reduce (bool)** – If enabled a custom `__reduce__` implementation won’t be provided.

**task(\*args, \*\*opts)**

Decorator to create a task class out of any callable.

See [Task options](#) for a list of the arguments that can be passed to this decorator.

**Examples**

```
@app.task
def refresh_feed(url):
    store_feed(feedparser.parse(url))
```

with setting extra options:

```
@app.task(exchange='feeds')
def refresh_feed(url):
    return store_feed(feedparser.parse(url))
```

---

**Note:** App Binding: For custom apps the task decorator will return a proxy object, so that the act of creating the task is not performed until the task is used or the task registry is accessed.

If you’re depending on binding to be deferred, then you must not access any attributes on the returned object until the application is fully set up (finalized).

---

**task\_cls = 'celery.app.task:Task'**

**tasks**

Task registry.

**Warning:** Accessing this attribute will also auto-finalize the app.

**property `thread_oid`**

Per-thread unique identifier for this app.

**`timezone`**

Current timezone for this app.

This is a cached property taking the time zone from the `:setting:`timezone`` setting.

**`user_options = None`**

Custom options for command-line programs. See [extending-commandoptions](#)

**`uses_utc_timezone()`**

Check if the application uses the UTC timezone.

**`worker_main(argv=None)`**

Run **celery worker** using *argv*.

Uses `sys.argv` if *argv* is not specified.

`app.celery.make_celery(app: flask.app.Flask) → celery.app.base.Celery`

### 2.1.3 `app.exceptions`

#### Description

Module for managing exceptions.

#### References

flask-restx: <https://flask-restx.readthedocs.io/en/latest/errors.html>

#### Functions

---

##### `init_app(app)`

---

##### `app.exceptions.init_app`

`app.exceptions.init_app(app: flask.app.Flask) → None`

## Exceptions

---

`FileNotFoundError`

---

`app.exceptions.FileNotFoundError`

`exception app.exceptions.FileNotFoundError`  
`exception app.exceptions.FileNotFoundError`

`args`

`characters_written`

`errno`

POSIX exception code

`filename`

exception filename

`filename2`

second exception filename

`strerror`

exception strerror

`with_traceback()`

Exception.with\_traceback(tb) – set self.\_\_traceback\_\_ to tb and return self.

`app.exceptions._handle_validation_error_exception(ex: marshmallow.exceptions.ValidationError) → tuple`

`app.exceptions.init_app(app: flask.app.Flask) → None`

### 2.1.4 app.extensions

#### Description

Registers third party extensions.

#### Functions

---

`init_app(app)`

---

**app.extensions.init\_app**

`app.extensions.init_app(app: flask.app.Flask) → None`

`app.extensions.init_app(app: flask.app.Flask) → None`

## 2.1.5 app.managers

### Description

Registers database managers.

The managers are classes for managing database queries through database models.

### Modules

---

`app.managers.base`

---

`app.managers.document`

---

`app.managers.role`

---

`app.managers.user`

---

### app.managers.base

#### Description

#### Classes

---

`BaseManager(*args, **kwargs)`

---

### app.managers.base.BaseManager

`class app.managers.base.BaseManager(*args, **kwargs)`  
Bases: object

## Methods

---

```
BaseManager.__init__(*args, **kwargs)
```

---

```
BaseManager.create(**kwargs)
```

---

```
BaseManager.delete(record_id)
```

---

```
BaseManager.find(record_id, *args)
```

---

```
BaseManager.get(**kwargs)
```

---

```
BaseManager.raw(query)
```

---

```
BaseManager.save(record_id, **kwargs)
```

---

### app.managers.base.BaseManager.\_\_init\_\_

```
BaseManager.__init__(*args, **kwargs)
```

### app.managers.base.BaseManager.create

```
BaseManager.create(**kwargs)
```

### app.managers.base.BaseManager.delete

```
BaseManager.delete(record_id: int)
```

### app.managers.base.BaseManager.find

```
BaseManager.find(record_id: int, *args)
```

### app.managers.base.BaseManager.get

```
BaseManager.get(**kwargs)
```

### app.managers.base.BaseManager.raw

```
BaseManager.raw(query: str)
```

**app.managers.base.BaseManager.save**

```
BaseManager . save(record_id: int, **kwargs)
class app.managers.base.BaseManager(*args, **kwargs)

    create(**kwargs)
    delete(record_id: int)
    find(record_id: int, *args)
    get(**kwargs)
    raw(query: str)
    save(record_id: int, **kwargs)
```

**app.managers.document****Description****Classes**

---

    get_last_record()
    raw(query: str)
    save(record_id: int, **kwargs)
```

## 2.1.6 app.middleware

### Description

WSGI middleware for validating requests content type.

### Classes

---

<code>Middleware(app)</code>	WSGI middleware for checking if the request has a valid content type.
------------------------------	---

---

### app.middleware.Middleware

`class app.middleware.Middleware(app: flask.app.Flask)`  
Bases: object

WSGI middleware for checking if the request has a valid content type.

#### Methods

---

`Middleware.__init__(app)`

---

`Middleware.parse_content_type(content_type)` Parser a request Content-Type.

#### app.middleware.Middleware.\_\_init\_\_

`Middleware.__init__(app: flask.app.Flask)`

#### app.middleware.Middleware.parse\_content\_type

`static Middleware.parse_content_type(content_type: str) → str`  
Parser a request Content-Type.

**Parameters** `content_type (str)` – Request Content Type.

**Returns** Parsed request Content Type.

**Return type** str

### References

RFC 1341 - MIME (Multipurpose Internet Mail Extensions): <https://tools.ietf.org/html/rfc1341>

## Examples

```
>>> from app.middleware import Middleware as m
>>> m.parse_content_type('multipart/form-data; boundary=something')
multipart/form-data
>>> m.parse_content_type('text/html; charset=utf-8')
text/html
```

`class app.middleware.Middleware(app: flask.app.Flask)`

WSGI middleware for checking if the request has a valid content type.

`static parse_content_type(content_type: str) → str`

Parser a request Content-Type.

**Parameters** `content_type (str)` – Request Content Type.

**Returns** Parsed request Content Type.

**Return type** str

## References

RFC 1341 - MIME (Multipurpose Internet Mail Extensions): <https://tools.ietf.org/html/rfc1341>

## Examples

```
>>> from app.middleware import Middleware as m

multipart/form-data
>>> m.parse_content_type('text/html; charset=utf-8')
text/html
```

## 2.1.7 app.models

### Description

Registers database models.

TODO: pending to define models with suffix “Model”.

There is not possible to rename the models with suffix “Model” because Flask-Security-Too doesn’t allow it. Maybe in the next major version could be available. <https://github.com/Flask-Middleware/flask-security/issues/395>

### Modules

<code>User.get_fields([exclude, include, sort_order])</code>	
<code>User.get_id()</code>	Returns the user identification attribute.
<code>User.get_or_create(**kwargs)</code>	
<code>User.get_or_none(*query, **filters)</code>	
<code>User.get_redirect_qparams([existing])</code>	Return user info that will be added to redirect query params.
<code>User.get_reset_token()</code>	
<code>User.get_security_payload()</code>	Serialize user object as response payload.
<code>User.has_permission(permission)</code>	Returns <i>True</i> if user has this permission (via a role it has).
<code>User.has_role(role)</code>	Returns <i>True</i> if the user identifies with the specified role.
<code>User.index(*fields, **kwargs)</code>	
<code>User.insert([_Model__data])</code>	
<code>User.insert_from(query, fields)</code>	
<code>User.insert_many(rows[, fields])</code>	
<code>User.is_alias()</code>	
<code>User.is_dirty()</code>	
<code>User.noop()</code>	
<code>User.raw(query)</code>	
<code>User.reload()</code>

Table 95 – continued from previous page

<code>User.replace([_Model_data])</code>	
<code>User.replace_many(rows[, fields])</code>	
<code>User.save(*args, **kwargs)</code>	
<code>User.select(*fields)</code>	
<code>User.set_by_id(key, value)</code>	
<code>User.table_exists()</code>	
<code>User.tf_send_security_token(method, **kwargs)</code>	Generate and send the security code for two-factor.
<code>User.truncate_table(**options)</code>	
<code>User.unwrap()</code>	
<code>User.update([_Model_data])</code>	
<code>User.us_send_security_token(method, **kwargs)</code>	Generate and send the security code for unified sign in.
<code>User.validate_model()</code>	
<code>User.verify_and_update_password(password)</code>	Returns True if the password is valid for the specified user.
<code>User.verify_auth_token(data)</code>	Perform additional verification of contents of auth token.
<code>User.verify_reset_token(token)</code>	

**app.models.user.User.\_\_init\_\_**`User.__init__(*args, **kwargs)`**app.models.user.User.add\_index**`classmethod User.add_index(*fields, **kwargs)`**app.models.user.User.alias**`classmethod User.alias(alias=None)`

**app.models.user.User.bind****classmethod User.bind(database, bind\_refs=True, bind\_backrefs=True, \_exclude=None)****app.models.user.User.bind\_ctx****classmethod User.bind\_ctx(database, bind\_refs=True, bind\_backrefs=True)****app.models.user.User.bulk\_create****classmethod User.bulk\_create(model\_list, batch\_size=None)****app.models.user.User.bulk\_update****classmethod User.bulk\_update(model\_list, fields, batch\_size=None)****app.models.user.User.calc\_username****User.calc\_username() → str**

Come up with the best ‘username’ based on how the app is configured (via SECURITY\_USER\_IDENTITY\_ATTRIBUTES). Returns the first non-null match (and converts to string). In theory this should NEVER be the empty string unless the user record isn’t actually valid.

New in version 3.4.0.

**app.models.user.User.clone****User.clone()****app.models.user.User.coerce****User.coerce(\_coerce=True)****app.models.user.User.copy****static User.copy(method)**

```
app.models.user.User.create

classmethod User.create(**query)

app.models.user.User.create_table

classmethod User.create_table(safe=True, **options)

app.models.user.User.delete

classmethod User.delete()

app.models.user.User.delete_by_id

classmethod User.delete_by_id(pk)

app.models.user.User.delete_instance

User.delete_instance(recursive=False, delete_nullable=False)

app.models.user.User.dependencies

User.dependencies(search_nullable=False)

app.models.user.User.drop_table

classmethod User.drop_table(safe=True, drop_sequences=True, **options)

app.models.user.User.ensure_password

static User.ensure_password(plain_text: str) → str

app.models.user.User.filter

classmethod User.filter(*dq_nodes, **filters)
```

**app.models.user.User.get****classmethod** `User.get(*query, **filters)`**app.models.user.User.get\_auth\_token**`User.get_auth_token() → Union[str, bytes]`

Constructs the user's authentication token.

**Raises ValueError** – If `fs_token_uniquifier` is part of model but not set.

Optionally use a separate uniquifier so that changing password doesn't invalidate auth tokens.

This data MUST be securely signed using the `remember_token_serializer`

Changed in version 4.0.0: If user model has `fs_token_uniquifier` - use that (raise ValueError if not set). Otherwise fallback to using `fs_uniqifier`.

**app.models.user.User.get\_by\_id****classmethod** `User.get_by_id(pk)`**app.models.user.User.get\_fields****classmethod** `User.get_fields(exclude: Optional[list] = None, include: Optional[list] = None, sort_order: Optional[list] = None) → set`**app.models.user.User.get\_id****User.get\_id()**

Returns the user identification attribute. ‘Alternative-token’ for Flask-Login. This is always `fs_uniqifier`.

New in version 3.4.0.

**app.models.user.User.get\_or\_create****classmethod** `User.get_or_create(**kwargs)`**app.models.user.User.get\_or\_none****classmethod** `User.get_or_none(*query, **filters)`

### `app.models.user.User.get_redirect_qparams`

`User.get_redirect_qparams(existing: Optional[Dict[str, Any]] = None) → Dict[str, Any]`

Return user info that will be added to redirect query params.

**Parameters** `existing` – A dict that will be updated.

**Returns** A dict whose keys will be query params and values will be query values.

The returned dict will always have an ‘identity’ key/value. If the User Model contains ‘email’, an ‘email’ key/value will be added. All keys provided in ‘existing’ will also be merged in.

New in version 3.2.0.

Changed in version 4.0.0: Add ‘identity’ using UserMixin.calc\_username() - email is optional.

### `app.models.user.User.get_reset_token`

`User.get_reset_token() → str`

### `app.models.user.User.get_security_payload`

`User.get_security_payload() → Dict[str, Any]`

Serialize user object as response payload. Override this to return any/all of the user object in JSON responses. Return a dict.

### `app.models.user.User.has_permission`

`User.has_permission(permission: str) → bool`

Returns *True* if user has this permission (via a role it has).

**Parameters** `permission` – permission string name

New in version 3.3.0.

### `app.models.user.User.has_role`

`User.has_role(role: Union[str, Role]) → bool`

Returns *True* if the user identifies with the specified role.

**Parameters** `role` – A role name or `Role` instance

### `app.models.user.User.index`

`classmethod User.index(*fields, **kwargs)`

```
app.models.user.User.insert

classmethod User.insert(_Model__data=None, **insert)

app.models.user.User.insert_from

classmethod User.insert_from(query, fields)

app.models.user.User.insert_many

classmethod User.insert_many(rows, fields=None)

app.models.user.User.is_alias

User.is_alias()

app.models.user.User.is_dirty

User.is_dirty()

app.models.user.User.noop

classmethod User.noop()

app.models.user.User.raw

static User.raw(query: str)

app.models.user.User.reload

User.reload()

app.models.user.User.replace

classmethod User.replace(_Model__data=None, **insert)
```

```
app.models.user.User.replace_many

classmethod User.replace_many(rows, fields=None) → None

app.models.user.User.save

User.save(*args: list, **kwargs: dict) → int

app.models.user.User.select

classmethod User.select(*fields) → list

app.models.user.User.set_by_id

classmethod User.set_by_id(key, value) → None

app.models.user.User.table_exists

classmethod User.table_exists() → bool

app.models.user.User.tf_send_security_token

User.tf_send_security_token(method: str, **kwargs: Any) → Optional[str]
    Generate and send the security code for two-factor.
    Parameters
        • method – The method in which the code will be sent
        • kwargs – Opaque parameters that are subject to change at any time
    Returns None if successful, error message if not.
    This is a wrapper around tf\_send\_security\_token\(\) that can be overridden to manage any errors.

    New in version 3.4.0.

app.models.user.User.truncate_table

classmethod User.truncate_table(**options) → None

app.models.user.User.unwrap

User.unwrap() → None
```

**app.models.user.User.update****classmethod** User.update(\_Model\_\_data=None, \*\*update)**app.models.user.User.us\_send\_security\_token****User.us\_send\_security\_token**(method: str, \*\*kwargs: Any) → Optional[str]

Generate and send the security code for unified sign in.

**Parameters**

- **method** – The method in which the code will be sent
- **kwargs** – Opaque parameters that are subject to change at any time

**Returns** None if successful, error message if not.This is a wrapper around [us\\_send\\_security\\_token\(\)](#) that can be overridden to manage any errors.

New in version 3.4.0.

**app.models.user.User.validate\_model****classmethod** User.validate\_model()**app.models.user.User.verify\_and\_update\_password****User.verify\_and\_update\_password**(password: str) → bool

Returns True if the password is valid for the specified user.

Additionally, the hashed password in the database is updated if the hashing algorithm happens to have changed.

N.B. you MUST call DB commit if you are using a session-based datastore (such as SQLAlchemy) since the user instance might have been altered (i.e. app.security.datastore.commit()).

This is usually handled in the view.

**Parameters** **password** – A plaintext password to verify

New in version 3.2.0.

**app.models.user.User.verify\_auth\_token****User.verify\_auth\_token**(data: Union[str, bytes]) → bool

Perform additional verification of contents of auth token. Prior to this being called the token has been validated (via signing) and has not expired.

**Parameters** **data** – the data as formulated by [get\\_auth\\_token\(\)](#)

New in version 3.3.0.

Changed in version 4.0.0: If user model has `fs_token_uniquifier` - use that otherwise use `fs_uniquifier`.

```
app.models.user.User.verify_reset_token

    static User.verify_reset_token(token: str) → any
class app.models.user.User(*args, **kwargs)
    User database model.
```

    Generate and send the security code for unified sign in.
```

#### Parameters

- **method** – The method in which the code will be sent
- **kwargs** – Opaque parameters that are subject to change at any time

**Returns** None if successful, error message if not.

This is a wrapper around `us_send_security_token()` that can be overridden to manage any errors.

New in version 3.4.0.

### userrolethrough\_set

```
classmethod validate_model()
```

```
verify_and_update_password(password: str) → bool
```

Returns True if the password is valid for the specified user.

Additionally, the hashed password in the database is updated if the hashing algorithm happens to have changed.

N.B. you MUST call DB commit if you are using a session-based datastore (such as SQLAlchemy) since the user instance might have been altered (i.e. `app.security.datastore.commit()`). This is usually handled in the view.

**Parameters** `password` – A plaintext password to verify

New in version 3.2.0.

```
verify_auth_token(data: Union[str, bytes]) → bool
```

Perform additional verification of contents of auth token. Prior to this being called the token has been validated (via signing) and has not expired.

**Parameters** `data` – the data as formulated by `get_auth_token()`

New in version 3.3.0.

Changed in version 4.0.0: If user model has `fs_token_uniquifier` - use that otherwise use `fs_uniquifier`.

## **2.1.8 app.serializers**

### **Description**

Modules for managing data from requests and responses.

Serializers are modules based on Marshmallow.

Marshmallow is an ORM/ODM/framework-agnostic library for converting complex datatypes, such as objects, to and from native Python datatypes.

In short, marshmallow schemas can be used to:

- Validate input data.
- Deserialize input data to app-level objects.
- Serialize app-level objects to primitive Python types. The serialized objects can then be rendered to standard formats such as JSON for use in an HTTP API.

### **References**

**Methods**

---

*AuthUserConfirmResetPasswordSerializer.**\_\_init\_\_(\*)*

*AuthUserConfirmResetPasswordSerializer*Serialize an object to native Python data types  
*dump(obj, \*)*according to this Schema's fields.

*AuthUserConfirmResetPasswordSerializer*Same as *dump()*, except return a JSON-encoded string.  
*dumps(...)*

*AuthUserConfirmResetPasswordSerializer*Generate a *Schema* class given a dictionary of  
*from\_dict(...)*fields.

*AuthUserConfirmResetPasswordSerializer*Defines how to pull values from an object to se-  
*get\_attribute(...)*rialize.

---

continues on next page

Table 100 – continued from previous page

<code>AuthUserConfirmResetPasswordSerializer</code>	Custom error handler function for the schema.
<code>handle_error(...)</code>	
<code>AuthUserConfirmResetPasswordSerializer</code>	Return a JSON response containing the serialized data.
<code>jsonify(obj)</code>	
<code>AuthUserConfirmResetPasswordSerializer</code>	Deserialize a data structure to an object defined by this Schema's fields.
<code>load(data, *)</code>	
<code>AuthUserConfirmResetPasswordSerializer</code>	Same as <code>load()</code> , except it takes a JSON string as input.
<code>loads(...)</code>	
<code>AuthUserConfirmResetPasswordSerializer</code>	
<code>make_object(...)</code>	
<code>AuthUserConfirmResetPasswordSerializer</code>	Hook to modify a field when it is bound to the Schema.
<code>on_bind_field(...)</code>	
<code>AuthUserConfirmResetPasswordSerializer</code>	Validate <code>data</code> against the schema, returning a dictionary of validation errors.
<code>validate(data, *)</code>	
<code>AuthUserConfirmResetPasswordSerializer</code>	
<code>validate_token(token)</code>	

**app.serializers.auth.AuthUserConfirmResetPasswordSerializer.\_\_init\_\_**

```
AuthUserConfirmResetPasswordSerializer.__init__(*, only:  
    Optional[Union[Sequence[str],  
    Set[str]]] = None, exclude:  
    Union[Sequence[str], Set[str]] = (),  
    many: bool = False, context:  
    Optional[Dict] = None, load_only:  
    Union[Sequence[str], Set[str]] = (),  
    dump_only: Union[Sequence[str],  
    Set[str]] = (), partial: Union[bool,  
    Sequence[str], Set[str]] = False,  
    unknown: Optional[str] = None)
```

**app.serializers.auth.AuthUserConfirmResetPasswordSerializer.dump**

`AuthUserConfirmResetPasswordSerializer.dump(obj: Any, *, many: Optional[bool] = None)`

Serialize an object to native Python data types according to this Schema's fields.

**Parameters**

- **obj** – The object to serialize.
- **many** – Whether to serialize `obj` as a collection. If `None`, the value for `self.many` is used.

**Returns** Serialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if `obj` is invalid.

Changed in version 3.0.0rc9: Validation no longer occurs upon serialization.

**app.serializers.auth.AuthUserConfirmResetPasswordSerializer.dumps**

```
AuthUserConfirmResetPasswordSerializer.dumps(obj: Any, *args, many: Optional[bool] = None, **kwargs)
```

Same as [dump\(\)](#), except return a JSON-encoded string.

**Parameters**

- **obj** – The object to serialize.
- **many** – Whether to serialize *obj* as a collection. If *None*, the value for *self.many* is used.

**Returns** A json string

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if *obj* is invalid.

**app.serializers.auth.AuthUserConfirmResetPasswordSerializer.from\_dict**

```
classmethod AuthUserConfirmResetPasswordSerializer.from_dict(fields: Dict[str, Union[marshmallow.fields.Field, type]], *, name: str = 'Generated-Schema') → type
```

Generate a *Schema* class given a dictionary of fields.

```
from marshmallow import Schema, fields

PersonSchema = Schema.from_dict({"name": fields.Str()})
print(PersonSchema().load({"name": "David"})) # => {'name': 'David'}
```

Generated schemas are not added to the class registry and therefore cannot be referred to by name in *Nested* fields.

**Parameters**

- **fields** (*dict*) – Dictionary mapping field names to field instances.
- **name** (*str*) – Optional name for the class, which will appear in the `repr` for the class.

New in version 3.0.0.

**app.serializers.auth.AuthUserConfirmResetPasswordSerializer.get\_attribute**

```
AuthUserConfirmResetPasswordSerializer.get_attribute(obj: Any, attr: str, default: Any)
```

Defines how to pull values from an object to serialize.

New in version 2.0.0.

Changed in version 3.0.0a1: Changed position of *obj* and *attr*.

### app.serializers.auth.AuthUserConfirmResetPasswordSerializer.handle\_error

```
AuthUserConfirmResetPasswordSerializer.handle_error(error: marshmallow.exceptions.ValidationError,  
data: Any, *, many: bool,  
**kwargs)
```

Custom error handler function for the schema.

#### Parameters

- **error** – The *ValidationError* raised during (de)serialization.
- **data** – The original input data.
- **many** – Value of `many` on dump or load.
- **partial** – Value of `partial` on load.

New in version 2.0.0.

Changed in version 3.0.0rc9: Receives `many` and `partial` (on deserialization) as keyword arguments.

### app.serializers.auth.AuthUserConfirmResetPasswordSerializer.jsonify

```
AuthUserConfirmResetPasswordSerializer.jsonify(obj, many=<object object>, *args,  
**kwargs)
```

Return a JSON response containing the serialized data.

#### Parameters

- **obj** – Object to serialize.
- **many (bool)** – Whether `obj` should be serialized as an instance or as a collection.  
If unset, defaults to the value of the `many` attribute on this Schema.
- **kwargs** – Additional keyword arguments passed to `flask.jsonify`.

Changed in version 0.6.0: Takes the same arguments as `marshmallow.Schema.dump`. Additional keyword arguments are passed to `flask.jsonify`.

Changed in version 0.6.3: The `many` argument for this method defaults to the value of the `many` attribute on the Schema. Previously, the `many` argument of this method defaulted to `False`, regardless of the value of `Schema.many`.

### app.serializers.auth.AuthUserConfirmResetPasswordSerializer.load

```
AuthUserConfirmResetPasswordSerializer.load(data: Union[Mapping[str, Any],  
Iterable[Mapping[str, Any]]], *, many:  
Optional[bool] = None, partial:  
Optional[Union[bool, Sequence[str],  
Set[str]]] = None, unknown:  
Optional[str] = None)
```

Deserialize a data structure to an object defined by this Schema's fields.

#### Parameters

- **data** – The data to deserialize.
- **many** – Whether to deserialize `data` as a collection. If `None`, the value for `self.many` is used.
- **partial** – Whether to ignore missing fields and not require any fields declared.  
Propagates down to `Nested` fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.

- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.

**Returns** Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if invalid data are passed.

### app.serializers.auth.AuthUserConfirmResetPasswordSerializer.loads

```
AuthUserConfirmResetPasswordSerializer.loads(json_data: str, *, many: Optional[bool] = None, partial: Optional[Union[bool, Sequence[str], Set[str]]] = None, unknown: Optional[str] = None, **kwargs)
```

Same as `load()`, except it takes a JSON string as input.

**Parameters**

- **json\_data** – A JSON string of the data to deserialize.
- **many** – Whether to deserialize *obj* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.

**Returns** Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if invalid data are passed.

### app.serializers.auth.AuthUserConfirmResetPasswordSerializer.make\_object

```
AuthUserConfirmResetPasswordSerializer.make_object(data, **kwargs)
```

### app.serializers.auth.AuthUserConfirmResetPasswordSerializer.on\_bind\_field

```
AuthUserConfirmResetPasswordSerializer.on_bind_field(field_name: str, field_obj: marshmallow.fields.Field) → None
```

Hook to modify a field when it is bound to the *Schema*.

No-op by default.

**app.serializers.auth.AuthUserConfirmResetPasswordSerializer.validate**

```
AuthUserConfirmResetPasswordSerializer.validate(data: Union[Mapping[str, Any],  
    Iterable[Mapping[str, Any]]], *,  
    many: Optional[bool] = None,  
    partial: Optional[Union[bool,  
        Sequence[str], Set[str]]] = None  
    → Dict[str, List[str]]]
```

Validate *data* against the schema, returning a dictionary of validation errors.

**Parameters**

- **data** – The data to validate.
- **many** – Whether to validate *data* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to `Nested` fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.

**Returns** A dictionary of validation errors.

New in version 1.1.0.

**app.serializers.auth.AuthUserConfirmResetPasswordSerializer.validate\_token**

```
AuthUserConfirmResetPasswordSerializer.validate_token(token)
```

**app.serializers.auth.AuthUserLoginSerializer**

```
class app.serializers.auth.AuthUserLoginSerializer(*, only: Optional[Union[Sequence[str], Set[str]]]  
    = None, exclude: Union[Sequence[str], Set[str]]  
    = (), many: bool = False, context: Optional[Dict]  
    = None, load_only: Union[Sequence[str],  
        Set[str]] = (), dump_only: Union[Sequence[str],  
        Set[str]] = (), partial: Union[bool, Sequence[str],  
        Set[str]] = False, unknown: Optional[str] =  
        None)
```

Bases: `flask_marshmallow.schema.Schema`

**Attributes**

---

*AuthUserLoginSerializer.*

`TYPE_MAPPING`

---

*AuthUserLoginSerializer.dict\_class*

```
AuthUserLoginSerializer.error_messages = {}
```

Overrides for default schema-level error messages

**app.serializers.auth.AuthUserLoginSerializer.opts**

```
AuthUserLoginSerializer.opts = <marshmallow.schema.SchemaOpts object>
```

**app.serializers.auth.AuthUserLoginSerializer.set\_class**

```
property AuthUserLoginSerializer.set_class: type
```

**Methods**

---

<i>AuthUserLoginSerializer.__init__(*[ only, ...])</i>	
<i>AuthUserLoginSerializer.dump(obj, *[ many])</i>	Serialize an object to native Python data types according to this Schema's fields.
<i>AuthUserLoginSerializer.dumps(obj, *args[, many])</i>	Same as <i>dump()</i> , except return a JSON-encoded string.
<i>AuthUserLoginSerializer. from_dict(fields, *)</i>	Generate a <i>Schema</i> class given a dictionary of fields.
<i>AuthUserLoginSerializer. get_attribute(obj, ...)</i>	Defines how to pull values from an object to serialize.

---

continues on next page

Table 102 – continued from previous page

<code>AuthUserLoginSerializer. handle_error(error, ...)</code>	Custom error handler function for the schema.
<code>AuthUserLoginSerializer.jsonify(obj[, many])</code>	Return a JSON response containing the serialized data.
<code>AuthUserLoginSerializer.load(data, *[ ...])</code>	Deserialize a data structure to an object defined by this Schema's fields.
<code>AuthUserLoginSerializer. loads(json_data, *)</code>	Same as <code>load()</code> , except it takes a JSON string as input.
<code>AuthUserLoginSerializer. make_object(data, ...)</code>	
<code>AuthUserLoginSerializer. on_bind_field(...)</code>	Hook to modify a field when it is bound to the Schema.
<code>AuthUserLoginSerializer. validate(data, *[...,])</code>	Validate <code>data</code> against the schema, returning a dictionary of validation errors.
<code>AuthUserLoginSerializer. validate_email(email)</code>	
<code>AuthUserLoginSerializer. validate_password(...)</code>	

**app.serializers.auth.AuthUserLoginSerializer.\_\_init\_\_**

```
AuthUserLoginSerializer.__init__(*, only: Optional[Union[Sequence[str], Set[str]]] = None, exclude: Union[Sequence[str], Set[str]] = (), many: bool = False, context: Optional[Dict] = None, load_only: Union[Sequence[str], Set[str]] = (), dump_only: Union[Sequence[str], Set[str]] = (), partial: Union[bool, Sequence[str], Set[str]] = False, unknown: Optional[str] = None)
```

**app.serializers.auth.AuthUserLoginSerializer.dump**

`AuthUserLoginSerializer.dump(obj: Any, *, many: Optional[bool] = None)`

Serialize an object to native Python data types according to this Schema's fields.

**Parameters**

- **obj** – The object to serialize.
- **many** – Whether to serialize `obj` as a collection. If `None`, the value for `self.many` is used.

**Returns** Serialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if `obj` is invalid.

Changed in version 3.0.0rc9: Validation no longer occurs upon serialization.

**app.serializers.auth.AuthUserLoginSerializer.dumps**

`AuthUserLoginSerializer.dumps(obj: Any, *args, many: Optional[bool] = None, **kwargs)`

Same as `dump()`, except return a JSON-encoded string.

**Parameters**

- **obj** – The object to serialize.
- **many** – Whether to serialize *obj* as a collection. If *None*, the value for *self.many* is used.

**Returns** A json string

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if *obj* is invalid.

**app.serializers.auth.AuthUserLoginSerializer.from\_dict**

**classmethod** `AuthUserLoginSerializer.from_dict(fields: Dict[str, Union[marshmallow.fields.Field, type]], *, name: str = 'GeneratedSchema') → type`

Generate a *Schema* class given a dictionary of fields.

```
from marshmallow import Schema, fields

PersonSchema = Schema.from_dict({"name": fields.Str()})
print(PersonSchema().load({"name": "David"})) # => {'name': 'David'}
```

Generated schemas are not added to the class registry and therefore cannot be referred to by name in *Nested* fields.

**Parameters**

- **fields** (*dict*) – Dictionary mapping field names to field instances.
- **name** (*str*) – Optional name for the class, which will appear in the `repr` for the class.

New in version 3.0.0.

**app.serializers.auth.AuthUserLoginSerializer.get\_attribute**

`AuthUserLoginSerializer.get_attribute(obj: Any, attr: str, default: Any)`

Defines how to pull values from an object to serialize.

New in version 2.0.0.

Changed in version 3.0.0a1: Changed position of *obj* and *attr*.

## app.serializers.auth.AuthUserLoginSerializer.handle\_error

```
AuthUserLoginSerializer.handle_error(error: marshmallow.exceptions.ValidationError,  
                                     data: Any, *, many: bool, **kwargs)
```

Custom error handler function for the schema.

### Parameters

- **error** – The *ValidationError* raised during (de)serialization.
- **data** – The original input data.
- **many** – Value of *many* on dump or load.
- **partial** – Value of *partial* on load.

New in version 2.0.0.

Changed in version 3.0.0rc9: Receives *many* and *partial* (on deserialization) as keyword arguments.

## app.serializers.auth.AuthUserLoginSerializer.jsonify

```
AuthUserLoginSerializer.jsonify(obj, many=<object object>, *args, **kwargs)
```

Return a JSON response containing the serialized data.

### Parameters

- **obj** – Object to serialize.
- **many** (*bool*) – Whether *obj* should be serialized as an instance or as a collection.  
If unset, defaults to the value of the *many* attribute on this Schema.
- **kwargs** – Additional keyword arguments passed to *flask.jsonify*.

Changed in version 0.6.0: Takes the same arguments as *marshmallow.Schema.dump*. Additional keyword arguments are passed to *flask.jsonify*.

Changed in version 0.6.3: The *many* argument for this method defaults to the value of the *many* attribute on the Schema. Previously, the *many* argument of this method defaulted to False, regardless of the value of *Schema.many*.

## app.serializers.auth.AuthUserLoginSerializer.load

```
AuthUserLoginSerializer.load(data: Union[Mapping[str, Any], Iterable[Mapping[str,  
                           Any]]], *, many: Optional[bool] = None, partial:  
                           Optional[Union[bool, Sequence[str], Set[str]]] = None,  
                           unknown: Optional[str] = None)
```

Deserialize a data structure to an object defined by this Schema's fields.

### Parameters

- **data** – The data to deserialize.
- **many** – Whether to deserialize *data* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.

### Returns

Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if invalid data are passed.

### `app.serializers.auth.AuthUserLoginSerializer.loads`

```
AuthUserLoginSerializer.loads(json_data: str, *, many: Optional[bool] = None, partial: Optional[Union[bool, Sequence[str], Set[str]]] = None, unknown: Optional[str] = None, **kwargs)
```

Same as `load()`, except it takes a JSON string as input.

#### Parameters

- **json\_data** – A JSON string of the data to deserialize.
- **many** – Whether to deserialize *obj* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.

#### Returns Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if invalid data are passed.

### `app.serializers.auth.AuthUserLoginSerializer.make_object`

```
AuthUserLoginSerializer.make_object(data, **kwargs)
```

### `app.serializers.auth.AuthUserLoginSerializer.on_bind_field`

```
AuthUserLoginSerializer.on_bind_field(field_name: str, field_obj: marshmallow.fields.Field) → None
```

Hook to modify a field when it is bound to the *Schema*.

No-op by default.

### `app.serializers.auth.AuthUserLoginSerializer.validate`

```
AuthUserLoginSerializer.validate(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, many: Optional[bool] = None, partial: Optional[Union[bool, Sequence[str], Set[str]]] = None) → Dict[str, List[str]]
```

Validate *data* against the schema, returning a dictionary of validation errors.

#### Parameters

- **data** – The data to validate.
- **many** – Whether to validate *data* as a collection. If *None*, the value for *self.many* is used.

- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.

**Returns** A dictionary of validation errors.

New in version 1.1.0.

### app.serializers.auth.AuthUserLoginSerializer.validate\_email

```
AuthUserLoginSerializer.validate_email(email)
```

### app.serializers.auth.AuthUserLoginSerializer.validate\_password

```
AuthUserLoginSerializer.validate_password(password)
```

```
class app.serializers.auth.AuthUserConfirmResetPasswordSerializer(*, only: Optional[Union[Sequence[str], Set[str]]] = None, exclude: Union[Sequence[str], Set[str]] = (), many: bool = False, context: Optional[Dict] = None, load_only: Union[Sequence[str], Set[str]] = (), dump_only: Union[Sequence[str], Set[str]] = (), partial: Union[bool, Sequence[str], Set[str]] = False, unknown: Optional[str] = None)
```

### class Meta

Options object for a Schema.

Example usage:

```
class Meta:  
    fields = ("id", "email", "date_created")  
    exclude = ("password", "secret_attribute")
```

Available options:

- **fields**: Tuple or list of fields to include in the serialized result.
- **additional**: Tuple or list of fields to include in addition to the explicitly declared fields. additional and fields are mutually-exclusive options.
- **include**: Dictionary of additional fields to include in the schema. It is usually better to define fields as class variables, but you may need to use this option, e.g., if your fields are Python keywords. May be an *OrderedDict*.
- **exclude**: Tuple or list of fields to exclude in the serialized result. Nested fields can be represented with dot delimiters.
- **dateformat**: Default format for *Date* <fields.Date> fields.
- **datetimetypeformat**: Default format for *DateTime* <fields.DateTime> fields.

- **timeformat**: Default format for *Time* <fields.Time> fields.
- **render\_module**: Module to use for *loads* <Schema.loads> and *dumps* <Schema.dumps>. Defaults to *json* from the standard library.
- **ordered**: If *True*, order serialization output according to the order in which fields were declared. Output of *Schema.dump* will be a *collections.OrderedDict*.
- **index\_errors**: If *True*, errors dictionaries will include the index of invalid items in a collection.
- **load\_only**: Tuple or list of fields to exclude from serialized results.
- **dump\_only**: Tuple or list of fields to exclude from deserialization
- **unknown**: Whether to exclude, include, or raise an error for unknown fields in the data. Use EX-*CLUE*, *INCLUDE* or *RAISE*.
- **register**: Whether to register the *Schema* with marshmallow's internal class registry. Must be *True* if you intend to refer to this *Schema* by class name in *Nested* fields. Only set this to *False* when memory usage is critical. Defaults to *True*.

#### OPTIONS\_CLASS

alias of `marshmallow.schema.SchemaOpts`

```
TYPE_MAPPING = {<class 'str'>: <class 'marshmallow.fields.String'>, <class 'bytes'>: <class 'marshmallow.fields.String'>, <class 'datetime.datetime'>: <class 'marshmallow.fields.DateTime'>, <class 'float'>: <class 'marshmallow.fields.Float'>, <class 'bool'>: <class 'marshmallow.fields.Boolean'>, <class 'tuple'>: <class 'marshmallow.fields.Raw'>, <class 'list'>: <class 'marshmallow.fields.Raw'>, <class 'set'>: <class 'marshmallow.fields.Raw'>, <class 'int'>: <class 'marshmallow.fields.Integer'>, <class 'uuid.UUID'>: <class 'marshmallow.fields.UUID'>, <class 'datetime.time'>: <class 'marshmallow.fields.Time'>, <class 'datetime.date'>: <class 'marshmallow.fields.Date'>, <class 'datetime.timedelta'>: <class 'marshmallow.fields.TimeDelta'>, <class 'decimal.Decimal'>: <class 'marshmallow.fields.Decimal'>}
```

**\_bind\_field**(*field\_name*: str, *field\_obj*: marshmallow.fields.Field) → None

Bind field to the schema, setting any necessary attributes on the field (e.g. parent and name).

Also set field *load\_only* and *dump\_only* values if *field\_name* was specified in *class Meta*.

**static \_call\_and\_store**(*getter\_func*, *data*, \*, *field\_name*, *error\_store*, *index=None*)

Call *getter\_func* with *data* as its argument, and store any *ValidationErrors*.

#### Parameters

- **getter\_func** (*callable*) – Function for getting the serialized/deserialized value from *data*.
- **data** – The data passed to *getter\_func*.
- **field\_name** (str) – Field name.
- **index** (int) – Index of the item being validated, if validating a collection, otherwise *None*.

```
_declared_fields = {'password': <fields.String(dump_default=<marshmallow.missing>, attribute=None, validate=<Length(min=8, max=50, equal=None, error=None)>, required=True, load_only=True, dump_only=False, load_default=<marshmallow.missing>, allow_none=False, error_messages={'required': 'Missing data for required field.', 'null': 'Field may not be null.', 'validator_failed': 'Invalid value.', 'invalid': 'Not a valid string.', 'invalid_utf8': 'Not a valid utf-8 string.'})>, 'token': <fields.String(dump_default=<marshmallow.missing>, attribute=None, validate=None, required=True, load_only=False, dump_only=False, load_default=<marshmallow.missing>, allow_none=False, error_messages={'required': 'Missing data for required field.', 'null': 'Field may not be null.', 'validator_failed': 'Invalid value.', 'invalid': 'Not a valid string.', 'invalid_utf8': 'Not a valid utf-8 string.'})>}
```

```
_default_error_messages = {'type': 'Invalid input type.', 'unknown': 'Unknown field.'}
```

```
_deserialize(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, error_store: marshmallow.error_store.ErrorStore, many: bool = False, partial=False, unknown='raise', index=None) → Union[marshmallow.schema._T, List[marshmallow.schema._T]]
```

Deserialize data.

#### Parameters

- **data** (*dict*) – The data to deserialize.
- **error\_store** (*ErrorStore*) – Structure to store errors.
- **many** (*bool*) – *True* if data should be serialized as a collection.
- **partial** (*bool / tuple*) – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*.
- **index** (*int*) – Index of the item being serialized (for storing errors) if serializing a collection, otherwise *None*.

**Returns** A dictionary of the serialized data.

```
_do_load(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, many: Optional[bool] = None, partial: Optional[Union[bool, Sequence[str], Set[str]]] = None, unknown: Optional[str] = None, postprocess: bool = True)
```

Deserialize *data*, returning the serialized result. This method is private API.

#### Parameters

- **data** – The data to deserialize.
- **many** – Whether to deserialize *data* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to validate required fields. If its value is an iterable, only fields listed in that iterable will be allowed missing. If *True*, all fields will be allowed missing. If *None*, the value for *self.partial* is used.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.
- **postprocess** – Whether to run post\_load methods..

**Returns** Deserialized data

```
_has_processors(tag) → bool
```

```
_hooks = defaultdict(<class 'list'>, {('post_load', False): ['make_object'],
'validates': ['validate_token']})

_init_fields() → None
    Update self.fields, self.load_fields, and self.dump_fields based on schema options. This method is private API.

_invoke_dump_processors(tag: str, data, *, many: bool, original_data=None)
_invoke_field_validators(*, error_store: marshmallow.error_store.ErrorStore, data, many: bool)
_invoke_load_processors(tag: str, data, *, many: bool, original_data, partial: Union[bool,
Sequence[str], Set[str]])]
_invoke_processors(tag: str, *, pass_many: bool, data, many: bool, original_data=None, **kwargs)
_invoke_schema_validators(*, error_store: marshmallow.error_store.ErrorStore, pass_many: bool, data,
original_data, many: bool, partial: Union[bool, Sequence[str], Set[str]], field_errors: bool = False)

_normalize_nested_options() → None
    Apply then flatten nested schema options. This method is private API.

_run_validator(serializer_func, output, *, original_data, error_store, many, partial, pass_original,
index=None)

_serialize(obj: Union[marshmallow.schema._T, Iterable[marshmallow.schema._T]], *, many: bool =
False)
    Serialize obj.
```

#### Parameters

- **obj** – The object(s) to serialize.
- **many (bool)** – *True* if data should be serialized as a collection.

#### Returns

A dictionary of the serialized data

Changed in version 1.0.0: Renamed from `marshal`.

**property dict\_class: type**

**dump**(*obj*: Any, \*, many: *Optional[bool]* = *None*)

Serialize an object to native Python data types according to this Schema's fields.

#### Parameters

- **obj** – The object to serialize.
- **many** – Whether to serialize *obj* as a collection. If *None*, the value for *self.many* is used.

#### Returns

Serialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a (`data`, `errors`) duple. A `ValidationError` is raised if *obj* is invalid.

Changed in version 3.0.0rc9: Validation no longer occurs upon serialization.

**dumps**(*obj*: Any, \*args, many: *Optional[bool]* = *None*, \*\*kwargs)

Same as `dump()`, except return a JSON-encoded string.

#### Parameters

- **obj** – The object to serialize.

- **many** – Whether to serialize *obj* as a collection. If *None*, the value for *self.many* is used.

**Returns** A json string

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a (*data*, *errors*) tuple. A `ValidationError` is raised if *obj* is invalid.

**error\_messages** = {}

Overrides for default schema-level error messages

**fields**

Dictionary mapping field\_names -> Field objects

**classmethod from\_dict**(*fields*: Dict[str, Union[marshmallow.fields.Field, type]], \*, *name*: str =

'GeneratedSchema') → type

Generate a *Schema* class given a dictionary of fields.

```
from marshmallow import Schema, fields
```

```
PersonSchema = Schema.from_dict({'name': fields.Str()})
print(PersonSchema().load({'name': 'David'})) # => {'name': 'David'}
```

Generated schemas are not added to the class registry and therefore cannot be referred to by name in *Nested* fields.

#### Parameters

- **fields** (*dict*) – Dictionary mapping field names to field instances.
- **name** (*str*) – Optional name for the class, which will appear in the `repr` for the class.

New in version 3.0.0.

**get\_attribute**(*obj*: Any, *attr*: str, *default*: Any)

Defines how to pull values from an object to serialize.

New in version 2.0.0.

Changed in version 3.0.0a1: Changed position of *obj* and *attr*.

**handle\_error**(*error*: marshmallow.exceptions.ValidationError, *data*: Any, \*, *many*: bool, \*\**kwargs*)

Custom error handler function for the schema.

#### Parameters

- **error** – The `ValidationError` raised during (de)serialization.
- **data** – The original input data.
- **many** – Value of `many` on dump or load.
- **partial** – Value of `partial` on load.

New in version 2.0.0.

Changed in version 3.0.0rc9: Receives `many` and `partial` (on deserialization) as keyword arguments.

**jsonify**(*obj*, *many*=<*object object*>, \**args*, \*\**kwargs*)

Return a JSON response containing the serialized data.

#### Parameters

- **obj** – Object to serialize.

- **many** (*bool*) – Whether *obj* should be serialized as an instance or as a collection. If unset, defaults to the value of the *many* attribute on this Schema.
- **kwargs** – Additional keyword arguments passed to *flask.jsonify*.

Changed in version 0.6.0: Takes the same arguments as *marshmallow.Schema.dump*. Additional keyword arguments are passed to *flask.jsonify*.

Changed in version 0.6.3: The *many* argument for this method defaults to the value of the *many* attribute on the Schema. Previously, the *many* argument of this method defaulted to False, regardless of the value of *Schema.many*.

**load**(*data*: *Union[Mapping[str, Any], Iterable[Mapping[str, Any]]]*, \*, *many*: *Optional[bool] = None*, *partial*: *Optional[Union[bool, Sequence[str], Set[str]]] = None*, *unknown*: *Optional[str] = None*)  
Deserialize a data structure to an object defined by this Schema's fields.

#### Parameters

- **data** – The data to deserialize.
- **many** – Whether to deserialize *data* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.

#### Returns

 Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a *(data, errors)* tuple. A *ValidationError* is raised if invalid data are passed.

**loads**(*json\_data*: *str*, \*, *many*: *Optional[bool] = None*, *partial*: *Optional[Union[bool, Sequence[str], Set[str]]] = None*, *unknown*: *Optional[str] = None*, \*\**kwargs*)  
Same as [load\(\)](#), except it takes a JSON string as input.

#### Parameters

- **json\_data** – A JSON string of the data to deserialize.
- **many** – Whether to deserialize *obj* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.

#### Returns

 Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a *(data, errors)* tuple. A *ValidationError* is raised if invalid data are passed.

**make\_object**(*data*, \*\**kwargs*)

**on\_bind\_field**(*field\_name*: *str*, *field\_obj*: *marshmallow.fields.Field*) → *None*  
Hook to modify a field when it is bound to the *Schema*.

No-op by default.

```
opts = <marshmallow.schema.SchemaOpts object>
property set_class: type
validate(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, many: Optional[bool] = None,
         partial: Optional[Union[bool, Sequence[str], Set[str]]] = None) → Dict[str, List[str]]
Validate data against the schema, returning a dictionary of validation errors.
```

#### Parameters

- **data** – The data to validate.
- **many** – Whether to validate *data* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.

**Returns** A dictionary of validation errors.

New in version 1.1.0.

#### validate\_token(token)

```
class app.serializers.auth.AuthUserLoginSerializer(*, only: Optional[Union[Sequence[str], Set[str]]]
                                                = None, exclude: Union[Sequence[str], Set[str]]
                                                = (), many: bool = False, context: Optional[Dict]
                                                = None, load_only: Union[Sequence[str],
                                                Set[str]] = (), dump_only: Union[Sequence[str],
                                                Set[str]] = (), partial: Union[bool, Sequence[str],
                                                Set[str]] = False, unknown: Optional[str] =
                                                None)
```

#### class Meta

Options object for a Schema.

Example usage:

```
class Meta:
    fields = ("id", "email", "date_created")
    exclude = ("password", "secret_attribute")
```

Available options:

- **fields**: Tuple or list of fields to include in the serialized result.
- **additional**: Tuple or list of fields to include in addition to the explicitly declared fields. additional and fields are mutually-exclusive options.
- **include**: Dictionary of additional fields to include in the schema. It is usually better to define fields as class variables, but you may need to use this option, e.g., if your fields are Python keywords. May be an *OrderedDict*.
- **exclude**: Tuple or list of fields to exclude in the serialized result. Nested fields can be represented with dot delimiters.
- **dateformat**: Default format for *Date* <fields.Date> fields.
- **datetimeformat**: Default format for *DateTime* <fields.DateTime> fields.
- **timeformat**: Default format for *Time* <fields.Time> fields.

- **render\_module**: Module to use for `loads` <`Schema.loads`> and `dumps` <`Schema.dumps`>. Defaults to `json` from the standard library.
- **ordered**: If `True`, order serialization output according to the order in which fields were declared. Output of `Schema.dump` will be a `collections.OrderedDict`.
- **index\_errors**: If `True`, errors dictionaries will include the index of invalid items in a collection.
- `load_only`: Tuple or list of fields to exclude from serialized results.
- `dump_only`: Tuple or list of fields to exclude from deserialization
- **unknown**: Whether to exclude, include, or raise an error for unknown fields in the data. Use `EXCLUDE`, `INCLUDE` or `RAISE`.
- **register**: Whether to register the `Schema` with marshmallow's internal class registry. Must be `True` if you intend to refer to this `Schema` by class name in `Nested` fields. Only set this to `False` when memory usage is critical. Defaults to `True`.

#### OPTIONS\_CLASS

alias of `marshmallow.schema.SchemaOpts`

```
TYPE_MAPPING = {<class 'str'>: <class 'marshmallow.fields.String'>, <class 'bytes'>: <class 'marshmallow.fields.String'>, <class 'datetime.datetime'>: <class 'marshmallow.fields.DateTime'>, <class 'float'>: <class 'marshmallow.fields.Float'>, <class 'bool'>: <class 'marshmallow.fields.Boolean'>, <class 'tuple'>: <class 'marshmallow.fields.Raw'>, <class 'list'>: <class 'marshmallow.fields.Raw'>, <class 'set'>: <class 'marshmallow.fields.Raw'>, <class 'int'>: <class 'marshmallow.fields.Integer'>, <class 'uuid.UUID'>: <class 'marshmallow.fields.UUID'>, <class 'datetime.time'>: <class 'marshmallow.fields.Time'>, <class 'datetime.date'>: <class 'marshmallow.fields.Date'>, <class 'datetime.timedelta'>: <class 'marshmallow.fields.TimeDelta'>, <class 'decimal.Decimal'>: <class 'marshmallow.fields.Decimal'>}
```

`_user = None`

`_bind_field(field_name: str, field_obj: marshmallow.fields.Field) → None`

Bind field to the schema, setting any necessary attributes on the field (e.g. parent and name).

Also set field `load_only` and `dump_only` values if `field_name` was specified in `class Meta`.

`static _call_and_store(getter_func, data, *, field_name, error_store, index=None)`

Call `getter_func` with `data` as its argument, and store any `ValidationErrors`.

#### Parameters

- **getter\_func** (`callable`) – Function for getting the serialized/deserialized value from `data`.
- **data** – The data passed to `getter_func`.
- **field\_name** (`str`) – Field name.
- **index** (`int`) – Index of the item being validated, if validating a collection, otherwise `None`.

```
_declared_fields = {'email': <fields.String(dump_default=<marshmallow.missing>, attribute=None, validate=None, required=True, load_only=True, dump_only=False, load_default=<marshmallow.missing>, allow_none=False, error_messages={'required': 'Missing data for required field.'}, 'null': 'Field may not be null.', 'validator_failed': 'Invalid value.', 'invalid': 'Not a valid string.', 'invalid_utf8': 'Not a valid utf-8 string.'}>, 'password': <fields.String(dump_default=<marshmallow.missing>, attribute=None, validate=<Length(min=8, max=50, equal=None, error=None)>, required=True, load_only=True, dump_only=False, load_default=<marshmallow.missing>, allow_none=False, error_messages={'required': 'Missing data for required field.', 'null': 'Field may not be null.', 'validator_failed': 'Invalid value.', 'invalid': 'Not a valid string.', 'invalid_utf8': 'Not a valid utf-8 string.'}>}
```

```
_default_error_messages = {'type': 'Invalid input type.', 'unknown': 'Unknown field.'}
```

```
_deserialize(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, error_store: marshmallow.error_store.ErrorStore, many: bool = False, partial=False, unknown='raise', index=None) → Union[marshmallow.schema._T, List[marshmallow.schema._T]]
```

Deserialize data.

#### Parameters

- **data** (*dict*) – The data to deserialize.
- **error\_store** (*ErrorStore*) – Structure to store errors.
- **many** (*bool*) – *True* if data should be serialized as a collection.
- **partial** (*bool / tuple*) – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*.
- **index** (*int*) – Index of the item being serialized (for storing errors) if serializing a collection, otherwise *None*.

**Returns** A dictionary of the serialized data.

```
_do_load(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, many: Optional[bool] = None, partial: Optional[Union[bool, Sequence[str], Set[str]]] = None, unknown: Optional[str] = None, postprocess: bool = True)
```

Deserialize *data*, returning the serialized result. This method is private API.

#### Parameters

- **data** – The data to deserialize.
- **many** – Whether to deserialize *data* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to validate required fields. If its value is an iterable, only fields listed in that iterable will be allowed missing. If *True*, all fields will be allowed missing. If *None*, the value for *self.partial* is used.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.
- **postprocess** – Whether to run post\_load methods..

**Returns** Deserialized data

```
_has_processors(tag) → bool
_hooks = defaultdict(<class 'list'>, {('post_load', False): ['make_object'],
'validates': ['validate_email', 'validate_password']})
_init_fields() → None
    Update self.fields, self.load_fields, and self.dump_fields based on schema options. This method is private API.
_invoke_dump_processors(tag: str, data, *, many: bool, original_data=None)
_invoke_field_validators(*, error_store: marshmallow.error_store.ErrorStore, data, many: bool)
_invoke_load_processors(tag: str, data, *, many: bool, original_data, partial: Union[bool,
Sequence[str], Set[str]])
_invoke_processors(tag: str, *, pass_many: bool, data, many: bool, original_data=None, **kwargs)
_invoke_schema_validators(*, error_store: marshmallow.error_store.ErrorStore, pass_many: bool, data,
original_data, many: bool, partial: Union[bool, Sequence[str], Set[str]], field_errors: bool = False)
_normalize_nested_options() → None
    Apply then flatten nested schema options. This method is private API.
_run_validator(serializer_func, output, *, original_data, error_store, many, partial, pass_original,
index=None)
_serialize(obj: Union[marshmallow.schema._T, Iterable[marshmallow.schema._T]]], *, many: bool =
False)
    Serialize obj.
```

#### Parameters

- **obj** – The object(s) to serialize.
- **many** (*bool*) – *True* if data should be serialized as a collection.

#### Returns

A dictionary of the serialized data

Changed in version 1.0.0: Renamed from `marshal`.

**property dict\_class: type**

**dump**(*obj*: Any, \*, *many*: *Optional[bool]* = *None*)

Serialize an object to native Python data types according to this Schema's fields.

#### Parameters

- **obj** – The object to serialize.
- **many** – Whether to serialize *obj* as a collection. If *None*, the value for *self.many* is used.

#### Returns

Serialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if *obj* is invalid.

Changed in version 3.0.0rc9: Validation no longer occurs upon serialization.

**dumps**(*obj*: Any, \**args*, *many*: *Optional[bool]* = *None*, \*\**kwargs*)

Same as `dump()`, except return a JSON-encoded string.

#### Parameters

- **obj** – The object to serialize.
- **many** – Whether to serialize *obj* as a collection. If *None*, the value for *self.many* is used.

**Returns** A json string

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a (*data*, *errors*) tuple. A `ValidationError` is raised if *obj* is invalid.

**error\_messages = {}**

Overrides for default schema-level error messages

**fields**

Dictionary mapping field\_names -> Field objects

**classmethod from\_dict(fields: Dict[str, Union[marshmallow.fields.Field, type]], \*, name: str = 'GeneratedSchema') → type**

Generate a *Schema* class given a dictionary of fields.

```
from marshmallow import Schema, fields

PersonSchema = Schema.from_dict({"name": fields.Str()})
print(PersonSchema().load({"name": "David"})) # => {'name': 'David'}
```

Generated schemas are not added to the class registry and therefore cannot be referred to by name in *Nested* fields.

#### Parameters

- **fields (dict)** – Dictionary mapping field names to field instances.
- **name (str)** – Optional name for the class, which will appear in the `repr` for the class.

New in version 3.0.0.

**get\_attribute(obj: Any, attr: str, default: Any)**

Defines how to pull values from an object to serialize.

New in version 2.0.0.

Changed in version 3.0.0a1: Changed position of *obj* and *attr*.

**handle\_error(error: marshmallow.exceptions.ValidationError, data: Any, \*, many: bool, \*\*kwargs)**

Custom error handler function for the schema.

#### Parameters

- **error** – The `ValidationError` raised during (de)serialization.
- **data** – The original input data.
- **many** – Value of `many` on dump or load.
- **partial** – Value of `partial` on load.

New in version 2.0.0.

Changed in version 3.0.0rc9: Receives `many` and `partial` (on deserialization) as keyword arguments.

**jsonify(obj, many=<object object>, \*args, \*\*kwargs)**

Return a JSON response containing the serialized data.

#### Parameters

- **obj** – Object to serialize.

- **many** (*bool*) – Whether *obj* should be serialized as an instance or as a collection. If unset, defaults to the value of the *many* attribute on this Schema.
- **kwargs** – Additional keyword arguments passed to *flask.jsonify*.

Changed in version 0.6.0: Takes the same arguments as *marshmallow.Schema.dump*. Additional keyword arguments are passed to *flask.jsonify*.

Changed in version 0.6.3: The *many* argument for this method defaults to the value of the *many* attribute on the Schema. Previously, the *many* argument of this method defaulted to False, regardless of the value of *Schema.many*.

**load**(*data*: *Union[Mapping[str, Any], Iterable[Mapping[str, Any]]]*, \*, *many*: *Optional[bool] = None*, *partial*: *Optional[Union[bool, Sequence[str], Set[str]]] = None*, *unknown*: *Optional[str] = None*)  
Deserialize a data structure to an object defined by this Schema's fields.

#### Parameters

- **data** – The data to deserialize.
- **many** – Whether to deserialize *data* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.

#### Returns

 Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a *(data, errors)* tuple. A *ValidationError* is raised if invalid data are passed.

**loads**(*json\_data*: *str*, \*, *many*: *Optional[bool] = None*, *partial*: *Optional[Union[bool, Sequence[str], Set[str]]] = None*, *unknown*: *Optional[str] = None*, \*\**kwargs*)  
Same as [load\(\)](#), except it takes a JSON string as input.

#### Parameters

- **json\_data** – A JSON string of the data to deserialize.
- **many** – Whether to deserialize *obj* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.

#### Returns

 Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a *(data, errors)* tuple. A *ValidationError* is raised if invalid data are passed.

**make\_object**(*data*, \*\**kwargs*)

**on\_bind\_field**(*field\_name*: *str*, *field\_obj*: *marshmallow.fields.Field*) → *None*  
Hook to modify a field when it is bound to the *Schema*.

No-op by default.

```
opts = <marshmallow.schema.SchemaOpts object>
property set_class: type
validate(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, many: Optional[bool] = None,
         partial: Optional[Union[bool, Sequence[str], Set[str]]] = None) → Dict[str, List[str]]
    Validate data against the schema, returning a dictionary of validation errors.
```

#### Parameters

- **data** – The data to validate.
- **many** – Whether to validate *data* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.

**Returns** A dictionary of validation errors.

New in version 1.1.0.

**validate\_email**(email)

**validate\_password**(password)

## app.serializers.core

### Description

#### Classes

---

**SearchSerializer**(\*[, only, exclude, many, ...])

---

<b>TimestampField</b> (*[, load_default, missing, ...])	Field that serializes to timestamp integer and deserializes to a datetime.datetime class.
---	---

---

## app.serializers.core.SearchSerializer

```
class app.serializers.core.SearchSerializer(*, only: Optional[Union[Sequence[str], Set[str]]] = None,
                                           exclude: Union[Sequence[str], Set[str]] = (), many: bool = False,
                                           context: Optional[Dict] = None, load_only:
                                           Union[Sequence[str], Set[str]] = (), dump_only:
                                           Union[Sequence[str], Set[str]] = (), partial: Union[bool,
                                           Sequence[str], Set[str]] = False, unknown: Optional[str] = None)
```

Bases: flask\_marshmallow.schema.Schema

**app.serializers.core.SearchSerializer.set\_class****property SearchSerializer.set\_class: type****Methods**

---

**SearchSerializer.\_\_init\_\_(\*[only, ...])**

<code>SearchSerializer.dump(obj, *[many])</code>	Serialize an object to native Python data types according to this Schema's fields.
<code>SearchSerializer.dumps(obj, *args[, many])</code>	Same as <code>dump()</code> , except return a JSON-encoded string.
<code>SearchSerializer.from_dict(fields, *[name])</code>	Generate a <i>Schema</i> class given a dictionary of fields.
<code>SearchSerializer.get_attribute(obj, attr, ...)</code>	Defines how to pull values from an object to serialize.
<code>SearchSerializer.handle_error(error, data, ...)</code>	Custom error handler function for the schema.
<code>SearchSerializer.jsonify(obj[, many])</code>	Return a JSON response containing the serialized data.
<code>SearchSerializer.load(data, *[many, ...])</code>	Deserialize a data structure to an object defined by this Schema's fields.
<code>SearchSerializer.loads(json_data, *[many, ...])</code>	Same as <code>load()</code> , except it takes a JSON string as input.
<code>SearchSerializer.on_bind_field(field_name, ...)</code>	Hook to modify a field when it is bound to the <i>Schema</i> .
<code>SearchSerializer.validate(data, *[many, ...])</code>	Validate <i>data</i> against the schema, returning a dictionary of validation errors.

**app.serializers.core.SearchSerializer.\_\_init\_\_**

```
SearchSerializer.__init__(*, only: Optional[Union[Sequence[str], Set[str]]] = None,  
                        exclude: Union[Sequence[str], Set[str]] = (), many: bool =  
                        False, context: Optional[Dict] = None, load_only:  
                        Union[Sequence[str], Set[str]] = (), dump_only:  
                        Union[Sequence[str], Set[str]] = (), partial: Union[bool,  
                        Sequence[str], Set[str]] = False, unknown: Optional[str] =  
                        None)
```

**app.serializers.core.SearchSerializer.dump****SearchSerializer.dump(obj: Any, \*, many: Optional[bool] = None)**

Serialize an object to native Python data types according to this Schema's fields.

**Parameters**

- **obj** – The object to serialize.
- **many** – Whether to serialize *obj* as a collection. If *None*, the value for *self.many* is used.

**Returns** Serialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if `obj` is invalid.

Changed in version 3.0.0rc9: Validation no longer occurs upon serialization.

### `app.serializers.core.SearchSerializer.dumps`

`SearchSerializer.dumps(obj: Any, *args, many: Optional[bool] = None, **kwargs)`

Same as `dump()`, except return a JSON-encoded string.

#### Parameters

- `obj` – The object to serialize.
- `many` – Whether to serialize `obj` as a collection. If `None`, the value for `self.many` is used.

#### Returns

A json string

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if `obj` is invalid.

### `app.serializers.core.SearchSerializer.from_dict`

`classmethod SearchSerializer.from_dict(fields: Dict[str, Union[marshmallow.fields.Field, type]], *, name: str = 'GeneratedSchema') → type`

Generate a `Schema` class given a dictionary of fields.

```
from marshmallow import Schema, fields

PersonSchema = Schema.from_dict({"name": fields.Str()})
print(PersonSchema().load({"name": "David"})) # => {'name': 'David'}
```

Generated schemas are not added to the class registry and therefore cannot be referred to by name in `Nested` fields.

#### Parameters

- `fields (dict)` – Dictionary mapping field names to field instances.
- `name (str)` – Optional name for the class, which will appear in the `repr` for the class.

New in version 3.0.0.

### `app.serializers.core.SearchSerializer.get_attribute`

`SearchSerializer.get_attribute(obj: Any, attr: str, default: Any)`

Defines how to pull values from an object to serialize.

New in version 2.0.0.

Changed in version 3.0.0a1: Changed position of `obj` and `attr`.

## app.serializers.core.SearchSerializer.handle\_error

```
SearchSerializer.handle_error(error: marshmallow.exceptions.ValidationError, data: Any,  
*, many: bool, **kwargs)
```

Custom error handler function for the schema.

### Parameters

- **error** – The *ValidationError* raised during (de)serialization.
- **data** – The original input data.
- **many** – Value of *many* on dump or load.
- **partial** – Value of *partial* on load.

New in version 2.0.0.

Changed in version 3.0.0rc9: Receives *many* and *partial* (on deserialization) as keyword arguments.

## app.serializers.core.SearchSerializer.jsonify

```
SearchSerializer.jsonify(obj, many=<object object>, *args, **kwargs)
```

Return a JSON response containing the serialized data.

### Parameters

- **obj** – Object to serialize.
- **many** (*bool*) – Whether *obj* should be serialized as an instance or as a collection.  
If unset, defaults to the value of the *many* attribute on this Schema.
- **kwargs** – Additional keyword arguments passed to *flask.jsonify*.

Changed in version 0.6.0: Takes the same arguments as *marshmallow.Schema.dump*. Additional keyword arguments are passed to *flask.jsonify*.

Changed in version 0.6.3: The *many* argument for this method defaults to the value of the *many* attribute on the Schema. Previously, the *many* argument of this method defaulted to False, regardless of the value of *Schema.many*.

## app.serializers.core.SearchSerializer.load

```
SearchSerializer.load(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *,  
many: Optional[bool] = None, partial: Optional[Union[bool,  
Sequence[str], Set[str]]] = None, unknown: Optional[str] = None)
```

Deserialize a data structure to an object defined by this Schema's fields.

### Parameters

- **data** – The data to deserialize.
- **many** – Whether to deserialize *data* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.

### Returns

Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a *(data, errors)* tuple. A *ValidationError* is raised if invalid data are passed.

**app.serializers.core.SearchSerializer.loads**

```
SearchSerializer.loads(json_data: str, *, many: Optional[bool] = None, partial:  
                      Optional[Union[bool, Sequence[str], Set[str]]] = None, unknown:  
                      Optional[str] = None, **kwargs)
```

Same as [load\(\)](#), except it takes a JSON string as input.

**Parameters**

- **json\_data** – A JSON string of the data to deserialize.
- **many** – Whether to deserialize *obj* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.

**Returns** Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if invalid data are passed.

**app.serializers.core.SearchSerializer.on\_bind\_field**

```
SearchSerializer.on_bind_field(field_name: str, field_obj: marshmallow.fields.Field) →  
                    None
```

Hook to modify a field when it is bound to the *Schema*.

No-op by default.

**app.serializers.core.SearchSerializer.validate**

```
SearchSerializer.validate(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *,  
                         many: Optional[bool] = None, partial: Optional[Union[bool,  
                                         Sequence[str], Set[str]]] = None) → Dict[str, List[str]]
```

Validate *data* against the schema, returning a dictionary of validation errors.

**Parameters**

- **data** – The data to validate.
- **many** – Whether to validate *data* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.

**Returns** A dictionary of validation errors.

New in version 1.1.0.

**app.serializers.core.TimestampField**

```
class app.serializers.core.TimestampField(*, load_default: Any = <marshmallow.missing>, missing:  
    Any = <marshmallow.missing>, dump_default: Any =  
    <marshmallow.missing>, default: Any =  
    <marshmallow.missing>, data_key: Optional[str] = None,  
    attribute: Optional[str] = None, validate:  
    Optional[Union[Callable[[Any], Any],  
    Iterable[Callable[[Any], Any]]]] = None, required: bool =  
    False, allow_none: Optional[bool] = None, load_only: bool  
    = False, dump_only: bool = False, error_messages:  
    Optional[Dict[str, str]] = None, metadata:  
    Optional[Mapping[str, Any]] = None,  
    **additional_metadata)
```

Bases: `marshmallow.fields.Field`

Field that serializes timestamp integer and deserializes to a `datetime.datetime` class.

**Attributes**

<code>TimestampField.context</code>	The context dictionary for the parent Schema.
<code>TimestampField.default</code>	
<code>TimestampField.default_error_messages</code>	Default error messages for various kinds of errors.
<code>TimestampField.missing</code>	
<code>TimestampField.name</code>	
<code>TimestampField.parent</code>	
<code>TimestampField.root</code>	

**app.serializers.core.TimestampField.context****property `TimestampField.context`**

The context dictionary for the parent Schema.

```
app.serializers.core.TimestampField.default

property TimestampField.default

app.serializers.core.TimestampField.default_error_messages

TimestampField.default_error_messages = {'null': 'Field may not be null.',
'required': 'Missing data for required field.', 'validator_failed':
'Invalid value.'}
```

Default error messages for various kinds of errors. The keys in this dictionary are passed to `Field.make_error`. The values are error messages passed to `marshmallow.exceptions.ValidationError`.

```
app.serializers.core.TimestampField.missing
```

```
property TimestampField.missing
```

```
app.serializers.core.TimestampField.name
```

```
TimestampField.name = None
```

```
app.serializers.core.TimestampField.parent
```

```
TimestampField.parent = None
```

```
app.serializers.core.TimestampField.root
```

```
TimestampField.root = None
```

## Methods

---

```
TimestampField.__init__(*,  
load_default, ...)
```

---

```
TimestampField.deserialize(value[, attr, Deserialize value.  
data])
```

```
TimestampField.fail(key, **kwargs)
```

Helper method that raises a `ValidationError` with an error message from `self.error_messages`.

```
TimestampField.get_value(obj, attr[, ...])
```

Return the value for a given key from an object.

```
TimestampField.make_error(key,  
**kwargs)
```

Helper method to make a `ValidationError` with an error message from `self.error_messages`.

```
TimestampField.serialize(attr, obj[, ac-  
cessor])
```

Pulls the value for the given key from the object, applies the field's formatting and returns the result.

---

### app.serializers.core.TimestampField.\_\_init\_\_

```
TimestampField.__init__(*, load_default: Any = <marshmallow.missing>, missing: Any =  
    <marshmallow.missing>, dump_default: Any =  
    <marshmallow.missing>, default: Any = <marshmallow.missing>,  
    data_key: Optional[str] = None, attribute: Optional[str] = None,  
    validate: Optional[Union[Callable[[Any], Any],  
        Iterable[Callable[[Any], Any]]]] = None, required: bool = False,  
    allow_none: Optional[bool] = None, load_only: bool = False,  
    dump_only: bool = False, error_messages: Optional[Dict[str, str]]  
    = None, metadata: Optional[Mapping[str, Any]] = None,  
    **additional_metadata) → None
```

### app.serializers.core.TimestampField.deserialize

```
TimestampField.deserialize(value: Any, attr: Optional[str] = None, data:  
    Optional[Mapping[str, Any]] = None, **kwargs)
```

Deserialize value.

#### Parameters

- **value** – The value to deserialize.
- **attr** – The attribute/key in *data* to deserialize.
- **data** – The raw input data passed to *Schema.load*.
- **kwargs** – Field-specific keyword arguments.

Raises **ValidationError** – If an invalid value is passed or if a required value is missing.

### app.serializers.core.TimestampField.fail

```
TimestampField.fail(key: str, **kwargs)
```

Helper method that raises a *ValidationError* with an error message from *self.error\_messages*.

Deprecated since version 3.0.0: Use *make\_error* *<marshmallow.fields.Field.make\_error>* instead.

### app.serializers.core.TimestampField.get\_value

```
TimestampField.get_value(obj, attr, accessor=None, default=<marshmallow.missing>)
```

Return the value for a given key from an object.

#### Parameters

- **obj** (*object*) – The object to get the value from.
- **attr** (*str*) – The attribute/key in *obj* to get the value from.
- **accessor** (*callable*) – A callable used to retrieve the value of *attr* from the object *obj*. Defaults to *marshmallow.utils.get\_value*.

**app.serializers.core.TimestampField.make\_error**

`TimestampField.make_error(key: str, **kwargs) → marshmallow.exceptions.ValidationError`  
Helper method to make a *ValidationError* with an error message from `self.error_messages`.

**app.serializers.core.TimestampField.serialize**

`TimestampField.serialize(attr: str, obj: Any, accessor: Optional[Callable[[Any, str, Any], Any]] = None, **kwargs)`

Pulls the value for the given key from the object, applies the field's formatting and returns the result.

**Parameters**

- `attr` – The attribute/key to get from the object.
- `obj` – The object to access the attribute/key from.
- `accessor` – Function used to access values from `obj`.
- `kwargs` – Field-specific keyword arguments.

```
class app.serializers.core.SearchSerializer(*, only: Optional[Union[Sequence[str], Set[str]]] = None,  
                                         exclude: Union[Sequence[str], Set[str]] = (), many: bool =  
                                         False, context: Optional[Dict] = None, load_only:  
                                         Union[Sequence[str], Set[str]] = (), dump_only:  
                                         Union[Sequence[str], Set[str]] = (), partial: Union[bool,  
                                         Sequence[str], Set[str]] = False, unknown: Optional[str] =  
                                         None)
```

**class Meta**

Options object for a Schema.

Example usage:

```
class Meta:  
    fields = ("id", "email", "date_created")  
    exclude = ("password", "secret_attribute")
```

Available options:

- **fields**: Tuple or list of fields to include in the serialized result.
- **additional**: Tuple or list of fields to include in addition to the explicitly declared fields. additional and fields are mutually-exclusive options.
- **include**: Dictionary of additional fields to include in the schema. It is usually better to define fields as class variables, but you may need to use this option, e.g., if your fields are Python keywords. May be an *OrderedDict*.
- **exclude**: Tuple or list of fields to exclude in the serialized result. Nested fields can be represented with dot delimiters.
- **dateformat**: Default format for *Date* <code>fields.Date</code> fields.
- **datetimetype**: Default format for *DateTime* <code>fields.DateTime</code> fields.
- **timeformat**: Default format for *Time* <code>fields.Time</code> fields.
- **render\_module**: Module to use for *loads* <code>Schema.loads</code> and *dumps* <code>Schema.dumps</code>. Defaults to `json` from the standard library.

- **ordered:** If *True*, order serialization output according to the order in which fields were declared.  
Output of *Schema.dump* will be a *collections.OrderedDict*.
- **index\_errors:** If *True*, errors dictionaries will include the index of invalid items in a collection.
- **load\_only:** Tuple or list of fields to exclude from serialized results.
- **dump\_only:** Tuple or list of fields to exclude from deserialization
- **unknown:** Whether to exclude, include, or raise an error for unknown fields in the data. Use EXCLUDE, INCLUDE or RAISE.
- **register:** Whether to register the *Schema* with marshmallow's internal class registry. Must be *True* if you intend to refer to this *Schema* by class name in *Nested* fields. Only set this to *False* when memory usage is critical. Defaults to *True*.

#### OPTIONS\_CLASS

alias of `marshmallow.schema.SchemaOpts`

```
TYPE_MAPPING = {<class 'str'>: <class 'marshmallow.fields.String'>, <class 'bytes'>: <class 'marshmallow.fields.String'>, <class 'datetime.datetime'>: <class 'marshmallow.fields.DateTime'>, <class 'float'>: <class 'marshmallow.fields.Float'>, <class 'bool'>: <class 'marshmallow.fields.Boolean'>, <class 'tuple'>: <class 'marshmallow.fields.Raw'>, <class 'list'>: <class 'marshmallow.fields.Raw'>, <class 'set'>: <class 'marshmallow.fields.Raw'>, <class 'int'>: <class 'marshmallow.fields.Integer'>, <class 'uuid.UUID'>: <class 'marshmallow.fields.UUID'>, <class 'datetime.time'>: <class 'marshmallow.fields.Time'>, <class 'datetime.date'>: <class 'marshmallow.fields.Date'>, <class 'datetime.timedelta'>: <class 'marshmallow.fields.TimeDelta'>, <class 'decimal.Decimal'>: <class 'marshmallow.fields.Decimal'>}
```

`_bind_field(field_name: str, field_obj: marshmallow.fields.Field) → None`

Bind field to the schema, setting any necessary attributes on the field (e.g. parent and name).

Also set field `load_only` and `dump_only` values if `field_name` was specified in class `Meta`.

`static _call_and_store(getter_func, data, *, field_name, error_store, index=None)`

Call `getter_func` with `data` as its argument, and store any `ValidationErrors`.

#### Parameters

- **getter\_func (callable)** – Function for getting the serialized/deserialized value from `data`.
- **data** – The data passed to `getter_func`.
- **field\_name (str)** – Field name.
- **index (int)** – Index of the item being validated, if validating a collection, otherwise `None`.

```
_declared_fields = {'items_per_page':  
<fields.Integer(dump_default=<marshmallow.missing>, attribute=None, validate=None,  
required=False, load_only=False, dump_only=False,  
load_default=<marshmallow.missing>, allow_none=False, error_messages={'required':  
'Missing data for required field.', 'null': 'Field may not be null.',  
'validator_failed': 'Invalid value.', 'invalid': 'Not a valid integer.',  
'too_large': 'Number too large.'})>, 'order':  
<fields.List(dump_default=<marshmallow.missing>, attribute=None, validate=None,  
required=False, load_only=False, dump_only=False,  
load_default=<marshmallow.missing>, allow_none=False, error_messages={'required':  
'Missing data for required field.', 'null': 'Field may not be null.',  
'validator_failed': 'Invalid value.', 'invalid': 'Not a valid list.'})>,  
'page_number': <fields.Integer(dump_default=<marshmallow.missing>, attribute=None,  
validate=None, required=False, load_only=False, dump_only=False,  
load_default=<marshmallow.missing>, allow_none=False, error_messages={'required':  
'Missing data for required field.', 'null': 'Field may not be null.',  
'validator_failed': 'Invalid value.', 'invalid': 'Not a valid integer.',  
'too_large': 'Number too large.'})>, 'search':  
<fields.List(dump_default=<marshmallow.missing>, attribute=None, validate=None,  
required=False, load_only=False, dump_only=False,  
load_default=<marshmallow.missing>, allow_none=False, error_messages={'required':  
'Missing data for required field.', 'null': 'Field may not be null.',  
'validator_failed': 'Invalid value.', 'invalid': 'Not a valid list.'})>}  
  
_default_error_messages = {'type': 'Invalid input type.', 'unknown': 'Unknown  
field.'}  
  
_deserialize(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, error_store:  
    marshmallow.error_store.ErrorStore, many: bool = False, partial=False, unknown='raise',  
    index=None) → Union[marshmallow.schema._T, List[marshmallow.schema._T]]
```

Deserialize data.

#### Parameters

- **data** (*dict*) – The data to deserialize.
- **error\_store** (*ErrorStore*) – Structure to store errors.
- **many** (*bool*) – *True* if data should be serialized as a collection.
- **partial** (*bool / tuple*) – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*.
- **index** (*int*) – Index of the item being serialized (for storing errors) if serializing a collection, otherwise *None*.

**Returns** A dictionary of the serialized data.

```
_do_load(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, many: Optional[bool] = None,  
    partial: Optional[Union[bool, Sequence[str], Set[str]]] = None, unknown: Optional[str] = None,  
    postprocess: bool = True)
```

Deserialize *data*, returning the serialized result. This method is private API.

#### Parameters

- **data** – The data to serialize.

- **many** – Whether to deserialize *data* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to validate required fields. If its value is an iterable, only fields listed in that iterable will be ignored will be allowed missing. If *True*, all fields will be allowed missing. If *None*, the value for *self.partial* is used.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.
- **postprocess** – Whether to run post\_load methods..

**Returns** Deserialized data

```
_has_processors(tag) → bool
_hooks = []
_init_fields() → None
    Update self.fields, self.load_fields, and self.dump_fields based on schema options. This method is private API.
_invoke_dump_processors(tag: str, data, *, many: bool, original_data=None)
_invoke_field_validators(*, error_store: marshmallow.error_store.ErrorStore, data, many: bool)
_invoke_load_processors(tag: str, data, *, many: bool, original_data, partial: Union[bool,
    Sequence[str], Set[str]])
_invoke_processors(tag: str, *, pass_many: bool, data, many: bool, original_data=None, **kwargs)
_invoke_schema_validators(*, error_store: marshmallow.error_store.ErrorStore, pass_many: bool, data,
    original_data, many: bool, partial: Union[bool, Sequence[str], Set[str]], field_errors: bool = False)
_normalize_nested_options() → None
    Apply then flatten nested schema options. This method is private API.
_run_validator(serializer_func, output, *, original_data, error_store, many, partial, pass_original,
    index=None)
_serialize(obj: Union[marshmallow.schema._T, Iterable[marshmallow.schema._T]], *, many: bool =
    False)
    Serialize obj.
```

#### Parameters

- **obj** – The object(s) to serialize.
- **many (bool)** – *True* if data should be serialized as a collection.

**Returns** A dictionary of the serialized data

Changed in version 1.0.0: Renamed from `marshal`.

**property dict\_class: type**

```
dump(obj: Any, *, many: Optional[bool] = None)
    Serialize an object to native Python data types according to this Schema's fields.
```

#### Parameters

- **obj** – The object to serialize.
- **many** – Whether to serialize *obj* as a collection. If *None*, the value for *self.many* is used.

**Returns** Serialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a (data, errors) tuple. A `ValidationError` is raised if `obj` is invalid.

Changed in version 3.0.0rc9: Validation no longer occurs upon serialization.

**dumps**(*obj*: Any, \**args*, *many*: Optional[bool] = None, \*\**kwargs*)

Same as `dump()`, except return a JSON-encoded string.

#### Parameters

- **obj** – The object to serialize.
- **many** – Whether to serialize `obj` as a collection. If `None`, the value for `self.many` is used.

#### Returns

A json string

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a (data, errors) tuple. A `ValidationError` is raised if `obj` is invalid.

**error\_messages** = {}

Overrides for default schema-level error messages

#### fields

Dictionary mapping field\_names -> Field objects

**classmethod from\_dict**(*fields*: Dict[str, Union[marshmallow.fields.Field, type]], \*, *name*: str = 'GeneratedSchema') → type

Generate a `Schema` class given a dictionary of fields.

```
from marshmallow import Schema, fields

PersonSchema = Schema.from_dict({'name': fields.Str()})
print(PersonSchema().load({'name': 'David'})) # => {'name': 'David'}
```

Generated schemas are not added to the class registry and therefore cannot be referred to by name in `Nested` fields.

#### Parameters

- **fields** (dict) – Dictionary mapping field names to field instances.
- **name** (str) – Optional name for the class, which will appear in the `repr` for the class.

New in version 3.0.0.

**get\_attribute**(*obj*: Any, *attr*: str, *default*: Any)

Defines how to pull values from an object to serialize.

New in version 2.0.0.

Changed in version 3.0.0a1: Changed position of `obj` and `attr`.

**handle\_error**(*error*: marshmallow.exceptions.ValidationError, *data*: Any, \*, *many*: bool, \*\**kwargs*)

Custom error handler function for the schema.

#### Parameters

- **error** – The `ValidationError` raised during (de)serialization.
- **data** – The original input data.
- **many** – Value of `many` on dump or load.

- **partial** – Value of `partial` on load.

New in version 2.0.0.

Changed in version 3.0.0rc9: Receives `many` and `partial` (on deserialization) as keyword arguments.

### `jsonify(obj, many=<object object>, *args, **kwargs)`

Return a JSON response containing the serialized data.

#### Parameters

- **obj** – Object to serialize.
- **many (bool)** – Whether `obj` should be serialized as an instance or as a collection. If unset, defaults to the value of the `many` attribute on this Schema.
- **kwargs** – Additional keyword arguments passed to `flask.jsonify`.

Changed in version 0.6.0: Takes the same arguments as `marshmallow.Schema.dump`. Additional keyword arguments are passed to `flask.jsonify`.

Changed in version 0.6.3: The `many` argument for this method defaults to the value of the `many` attribute on the Schema. Previously, the `many` argument of this method defaulted to False, regardless of the value of `Schema.many`.

### `load(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, many: Optional[bool] = None, partial: Optional[Union[bool, Sequence[str], Set[str]]] = None, unknown: Optional[str] = None)`

Deserialize a data structure to an object defined by this Schema's fields.

#### Parameters

- **data** – The data to deserialize.
- **many** – Whether to deserialize `data` as a collection. If `None`, the value for `self.many` is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use `EXCLUDE`, `INCLUDE` or `RAISE`. If `None`, the value for `self.unknown` is used.

#### Returns Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if invalid data are passed.

### `loads(json_data: str, *, many: Optional[bool] = None, partial: Optional[Union[bool, Sequence[str], Set[str]]] = None, unknown: Optional[str] = None, **kwargs)`

Same as `load()`, except it takes a JSON string as input.

#### Parameters

- **json\_data** – A JSON string of the data to deserialize.
- **many** – Whether to deserialize `obj` as a collection. If `None`, the value for `self.many` is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use `EXCLUDE`, `INCLUDE` or `RAISE`. If `None`, the value for `self.unknown` is used.

**Returns** Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if invalid data are passed.

`on_bind_field(field_name: str, field_obj: marshmallow.fields.Field) → None`

Hook to modify a field when it is bound to the `Schema`.

No-op by default.

`opts = <marshmallow.schema.SchemaOpts object>`

`property set_class: type`

`validate(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, many: Optional[bool] = None, partial: Optional[Union[bool, Sequence[str], Set[str]]] = None) → Dict[str, List[str]]`

Validate `data` against the schema, returning a dictionary of validation errors.

#### Parameters

- `data` – The data to validate.
- `many` – Whether to validate `data` as a collection. If `None`, the value for `self.many` is used.
- `partial` – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.

**Returns** A dictionary of validation errors.

New in version 1.1.0.

```
class app.serializers.core.TimestampField(*, load_default: Any = <marshmallow.missing>, missing: Any = <marshmallow.missing>, dump_default: Any = <marshmallow.missing>, default: Any = <marshmallow.missing>, data_key: Optional[str] = None, attribute: Optional[str] = None, validate: Optional[Union[Callable[[Any], Any], Iterable[Callable[[Any], Any]]]] = None, required: bool = False, allow_none: Optional[bool] = None, load_only: bool = False, dump_only: bool = False, error_messages: Optional[Dict[str, str]] = None, metadata: Optional[Mapping[str, Any]] = None, **additional_metadata)
```

Field that serializes to timestamp integer and deserializes to a `datetime.datetime` class.

`_CHECK_ATTRIBUTE = True`

`_bind_to_schema(field_name, schema)`

Update field with values from its parent schema. Called by `Schema._bind_field`.

#### Parameters

- `field_name (str)` – Field name set in schema.
- `schema (Schema / Field)` – Parent object.

`_creation_index = 129`

`_deserialize(value, attr, data, **kwargs)`

Deserialize value. Concrete Field classes should implement this method.

#### Parameters

- **value** – The value to be deserialized.
- **attr** – The attribute/key in *data* to be deserialized.
- **data** – The raw input data passed to the *Schema.load*.
- **kwargs** – Field-specific keyword arguments.

**Raises** `ValidationError` – In case of formatting or validation failure.

**Returns** The deserialized value.

Changed in version 2.0.0: Added `attr` and `data` parameters.

Changed in version 3.0.0: Added `**kwargs` to signature.

#### `_serialize(value, attr, obj, **kwargs)`

Serializes `value` to a basic Python datatype. Noop by default. Concrete Field classes should implement this method.

Example:

```
class TitleCase(Field):  
    def _serialize(self, value, attr, obj, **kwargs):  
        if not value:  
            return ''  
        return str(value).title()
```

#### Parameters

- **value** – The value to be serialized.
- **attr (str)** – The attribute or key on the object to be serialized.
- **obj (object)** – The object the value was pulled from.
- **kwargs (dict)** – Field-specific keyword arguments.

**Returns** The serialized value

#### `_validate(value)`

Perform validation on `value`. Raise a `ValidationError` if validation does not succeed.

#### `property _validate_all`

#### `_validate_missing(value)`

Validate missing values. Raise a `ValidationError` if `value` should be considered missing.

#### `property context`

The context dictionary for the parent Schema.

#### `property default`

```
default_error_messages = {'null': 'Field may not be null.', 'required': 'Missing  
data for required field.', 'validator_failed': 'Invalid value.'}
```

Default error messages for various kinds of errors. The keys in this dictionary are passed to `Field.make_error`. The values are error messages passed to `marshmallow.exceptions.ValidationError`.

#### `deserialize(value: Any, attr: Optional[str] = None, data: Optional[Mapping[str, Any]] = None, **kwargs)`

Deserialize `value`.

#### Parameters

- **value** – The value to deserialize.

- **attr** – The attribute/key in *data* to deserialize.
- **data** – The raw input data passed to *Schema.load*.
- **kwargs** – Field-specific keyword arguments.

**Raises ValidationError** – If an invalid value is passed or if a required value is missing.

**fail(key: str, \*\*kwargs)**

Helper method that raises a *ValidationError* with an error message from `self.error_messages`.

Deprecated since version 3.0.0: Use `make_error <marshmallow.fields.Field.make_error>` instead.

**get\_value(obj, attr, accessor=None, default=<marshmallow.missing>)**

Return the value for a given key from an object.

#### Parameters

- **obj (object)** – The object to get the value from.
- **attr (str)** – The attribute/key in *obj* to get the value from.
- **accessor (callable)** – A callable used to retrieve the value of *attr* from the object *obj*. Defaults to `marshmallow.utils.get_value`.

**make\_error(key: str, \*\*kwargs) → marshmallow.exceptions.ValidationError**

Helper method to make a *ValidationError* with an error message from `self.error_messages`.

**property missing**

**name = None**

**parent = None**

**root = None**

**serialize(attr: str, obj: Any, accessor: Optional[Callable[[Any, str, Any], Any]] = None, \*\*kwargs)**

Pulls the value for the given key from the object, applies the field's formatting and returns the result.

#### Parameters

- **attr** – The attribute/key to get from the object.
- **obj** – The object to access the attribute/key from.
- **accessor** – Function used to access values from *obj*.
- **kwargs** – Field-specific keyword arguments.

```
class app.serializers.core._SearchOrderSerializer(*, only: Optional[Union[Sequence[str], Set[str]]] = None, exclude: Union[Sequence[str], Set[str]] = (), many: bool = False, context: Optional[Dict] = None, load_only: Union[Sequence[str], Set[str]] = (), dump_only: Union[Sequence[str], Set[str]] = (), partial: Union[bool, Sequence[str], Set[str]] = False, unknown: Optional[str] = None)
```

**class Meta**

Options object for a Schema.

Example usage:

```
class Meta:  
    fields = ("id", "email", "date_created")  
    exclude = ("password", "secret_attribute")
```

Available options:

- **fields**: Tuple or list of fields to include in the serialized result.
- **additional**: Tuple or list of fields to include *in addition to the* explicitly declared fields. additional and fields are mutually-exclusive options.
- **include**: Dictionary of additional fields to include in the schema. It is usually better to define fields as class variables, but you may need to use this option, e.g., if your fields are Python keywords. May be an *OrderedDict*.
- **exclude**: Tuple or list of fields to exclude in the serialized result. Nested fields can be represented with dot delimiters.
- **dateformat**: Default format for *Date* <fields.Date> fields.
- **datetimeformat**: Default format for *DateTime* <fields.DateTime> fields.
- **timeformat**: Default format for *Time* <fields.Time> fields.
- **render\_module**: Module to use for *loads* <Schema.loads> and *dumps* <Schema.dumps>. Defaults to *json* from the standard library.
- **ordered**: If *True*, order serialization output according to the order in which fields were declared. Output of *Schema.dump* will be a *collections.OrderedDict*.
- **index\_errors**: If *True*, errors dictionaries will include the index of invalid items in a collection.
- **load\_only**: Tuple or list of fields to exclude from serialized results.
- **dump\_only**: Tuple or list of fields to exclude from deserialization
- **unknown**: Whether to exclude, include, or raise an error for unknown fields in the data. Use EXCLUDE, INCLUDE or RAISE.
- **register**: Whether to register the Schema with marshmallow's internal class registry. Must be *True* if you intend to refer to this Schema by class name in Nested fields. Only set this to *False* when memory usage is critical. Defaults to *True*.

## OPTIONS\_CLASS

alias of `marshmallow.schema.SchemaOpts`

```
TYPE_MAPPING = {<class 'str'>: <class 'marshmallow.fields.String'>, <class 'bytes'>: <class 'marshmallow.fields.String'>, <class 'datetime.datetime'>: <class 'marshmallow.fields.DateTime'>, <class 'float'>: <class 'marshmallow.fields.Float'>, <class 'bool'>: <class 'marshmallow.fields.Boolean'>, <class 'tuple'>: <class 'marshmallow.fields.Raw'>, <class 'list'>: <class 'marshmallow.fields.Raw'>, <class 'set'>: <class 'marshmallow.fields.Raw'>, <class 'int'>: <class 'marshmallow.fields.Integer'>, <class 'uuid.UUID'>: <class 'marshmallow.fields.UUID'>, <class 'datetime.time'>: <class 'marshmallow.fields.Time'>, <class 'datetime.date'>: <class 'marshmallow.fields.Date'>, <class 'datetime.timedelta'>: <class 'marshmallow.fields.TimeDelta'>, <class 'decimal.Decimal'>: <class 'marshmallow.fields.Decimal'>}
```

**\_bind\_field**(*field\_name*: str, *field\_obj*: `marshmallow.fields.Field`) → None

Bind field to the schema, setting any necessary attributes on the field (e.g. parent and name).

Also set field *load\_only* and *dump\_only* values if *field\_name* was specified in class *Meta*.

**static \_call\_and\_store**(*getter\_func*, *data*, \*, *field\_name*, *error\_store*, *index=None*)

Call *getter\_func* with *data* as its argument, and store any *ValidationErrors*.

## Parameters

- **getter\_func** (*callable*) – Function for getting the serialized/deserialized value from data.
- **data** – The data passed to `getter_func`.
- **field\_name** (*str*) – Field name.
- **index** (*int*) – Index of the item being validated, if validating a collection, otherwise *None*.

```
_declared_fields = {'field_name':  
<fields.String(dump_default=<marshmallow.missing>, attribute=None, validate=None,  
required=False, load_only=False, dump_only=False,  
load_default=<marshmallow.missing>, allow_none=False, error_messages={'required':  
'Missing data for required field.', 'null': 'Field may not be null.',  
'validator_failed': 'Invalid value.', 'invalid': 'Not a valid string.',  
'invalid_utf8': 'Not a valid utf-8 string.'}>, 'sorting':  
<fields.String(dump_default=<marshmallow.missing>, attribute=None,  
validate=<OneOf(choices=['asc', 'desc'], labels=[], error='Must be one of:  
{choices}.')>, required=False, load_only=False, dump_only=False,  
load_default=<marshmallow.missing>, allow_none=False, error_messages={'required':  
'Missing data for required field.', 'null': 'Field may not be null.',  
'validator_failed': 'Invalid value.', 'invalid': 'Not a valid string.',  
'invalid_utf8': 'Not a valid utf-8 string.'}>}  
  
_default_error_messages = {'type': 'Invalid input type.', 'unknown': 'Unknown  
field.'}  
  
_deserialize(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, error_store:  
    marshmallow.error_store.ErrorStore, many: bool = False, partial=False, unknown='raise',  
    index=None) → Union[marshmallow.schema._T, List[marshmallow.schema._T]]
```

Deserialize data.

#### Parameters

- **data** (*dict*) – The data to deserialize.
- **error\_store** (*ErrorStore*) – Structure to store errors.
- **many** (*bool*) – *True* if data should be serialized as a collection.
- **partial** (*bool / tuple*) – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*.
- **index** (*int*) – Index of the item being serialized (for storing errors) if serializing a collection, otherwise *None*.

**Returns** A dictionary of the serialized data.

```
_do_load(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, many: Optional[bool] = None,  
    partial: Optional[Union[bool, Sequence[str], Set[str]]] = None, unknown: Optional[str] = None,  
    postprocess: bool = True)
```

Deserialize *data*, returning the serialized result. This method is private API.

#### Parameters

- **data** – The data to deserialize.
- **many** – Whether to deserialize *data* as a collection. If *None*, the value for *self.many* is used.

- **partial** – Whether to validate required fields. If its value is an iterable, only fields listed in that iterable will be ignored will be allowed missing. If *True*, all fields will be allowed missing. If *None*, the value for *self.partial* is used.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.
- **postprocess** – Whether to run post\_load methods..

**Returns** Deserialized data

```
_has_processors(tag) → bool
_hooks = {}
_init_fields() → None
    Update self.fields, self.load_fields, and self.dump_fields based on schema options. This method is private API.
_invoke_dump_processors(tag: str, data, *, many: bool, original_data=None)
_invoke_field_validators(*, error_store: marshmallow.error_store.ErrorStore, data, many: bool)
_invoke_load_processors(tag: str, data, *, many: bool, original_data, partial: Union[bool,
    Sequence[str], Set[str]])
_invoke_processors(tag: str, *, pass_many: bool, data, many: bool, original_data=None, **kwargs)
_invoke_schema_validators(*, error_store: marshmallow.error_store.ErrorStore, pass_many: bool, data,
    original_data, many: bool, partial: Union[bool, Sequence[str], Set[str]], field_errors: bool = False)
_normalize_nested_options() → None
    Apply then flatten nested schema options. This method is private API.
_run_validator(func, output, *, original_data, error_store, many, partial, pass_original,
    index=None)
_serialize(obj: Union[marshmallow.schema._T, Iterable[marshmallow.schema._T]]], *, many: bool =
    False)
    Serialize obj.
```

#### Parameters

- **obj** – The object(s) to serialize.
- **many** (*bool*) – *True* if data should be serialized as a collection.

**Returns** A dictionary of the serialized data

Changed in version 1.0.0: Renamed from `marshal`.

**property dict\_class: type**

```
dump(obj: Any, *, many: Optional[bool] = None)
```

Serialize an object to native Python data types according to this Schema's fields.

#### Parameters

- **obj** – The object to serialize.
- **many** – Whether to serialize *obj* as a collection. If *None*, the value for *self.many* is used.

**Returns** Serialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a (data, errors) tuple. A `ValidationError` is raised if `obj` is invalid.

Changed in version 3.0.0rc9: Validation no longer occurs upon serialization.

**`dumps`(`obj: Any, *args, many: Optional[bool] = None, **kwargs`)**

Same as `dump()`, except return a JSON-encoded string.

#### Parameters

- **obj** – The object to serialize.
- **many** – Whether to serialize `obj` as a collection. If `None`, the value for `self.many` is used.

#### Returns

A json string

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a (data, errors) tuple. A `ValidationError` is raised if `obj` is invalid.

**`error_messages = {}`**

Overrides for default schema-level error messages

#### fields

Dictionary mapping field\_names -> Field objects

**`classmethod from_dict(fields: Dict[str, Union[marshmallow.fields.Field, type]], *, name: str = 'GeneratedSchema') → type`**

Generate a `Schema` class given a dictionary of fields.

```
from marshmallow import Schema, fields

PersonSchema = Schema.from_dict({'name': fields.Str()})
print(PersonSchema().load({'name': 'David'})) # => {'name': 'David'}
```

Generated schemas are not added to the class registry and therefore cannot be referred to by name in `Nested` fields.

#### Parameters

- **fields (dict)** – Dictionary mapping field names to field instances.
- **name (str)** – Optional name for the class, which will appear in the `repr` for the class.

New in version 3.0.0.

**`get_attribute(obj: Any, attr: str, default: Any)`**

Defines how to pull values from an object to serialize.

New in version 2.0.0.

Changed in version 3.0.0a1: Changed position of `obj` and `attr`.

**`handle_error(error: marshmallow.exceptions.ValidationError, data: Any, *, many: bool, **kwargs)`**

Custom error handler function for the schema.

#### Parameters

- **error** – The `ValidationError` raised during (de)serialization.
- **data** – The original input data.
- **many** – Value of `many` on `dump` or `load`.

- **partial** – Value of `partial` on load.

New in version 2.0.0.

Changed in version 3.0.0rc9: Receives `many` and `partial` (on deserialization) as keyword arguments.

### `jsonify(obj, many=<object object>, *args, **kwargs)`

Return a JSON response containing the serialized data.

#### Parameters

- **obj** – Object to serialize.
- **many (bool)** – Whether `obj` should be serialized as an instance or as a collection. If unset, defaults to the value of the `many` attribute on this Schema.
- **kwargs** – Additional keyword arguments passed to `flask.jsonify`.

Changed in version 0.6.0: Takes the same arguments as `marshmallow.Schema.dump`. Additional keyword arguments are passed to `flask.jsonify`.

Changed in version 0.6.3: The `many` argument for this method defaults to the value of the `many` attribute on the Schema. Previously, the `many` argument of this method defaulted to False, regardless of the value of `Schema.many`.

### `load(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, many: Optional[bool] = None, partial: Optional[Union[bool, Sequence[str], Set[str]]] = None, unknown: Optional[str] = None)`

Deserialize a data structure to an object defined by this Schema's fields.

#### Parameters

- **data** – The data to deserialize.
- **many** – Whether to deserialize `data` as a collection. If `None`, the value for `self.many` is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use `EXCLUDE`, `INCLUDE` or `RAISE`. If `None`, the value for `self.unknown` is used.

#### Returns Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if invalid data are passed.

### `loads(json_data: str, *, many: Optional[bool] = None, partial: Optional[Union[bool, Sequence[str], Set[str]]] = None, unknown: Optional[str] = None, **kwargs)`

Same as `load()`, except it takes a JSON string as input.

#### Parameters

- **json\_data** – A JSON string of the data to deserialize.
- **many** – Whether to deserialize `obj` as a collection. If `None`, the value for `self.many` is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use `EXCLUDE`, `INCLUDE` or `RAISE`. If `None`, the value for `self.unknown` is used.

**Returns** Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if invalid data are passed.

`on_bind_field(field_name: str, field_obj: marshmallow.fields.Field) → None`

Hook to modify a field when it is bound to the `Schema`.

No-op by default.

`opts = <marshmallow.schema.SchemaOpts object>`

`property set_class: type`

`validate(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, many: Optional[bool] = None, partial: Optional[Union[bool, Sequence[str], Set[str]]] = None) → Dict[str, List[str]]`

Validate `data` against the schema, returning a dictionary of validation errors.

#### Parameters

- `data` – The data to validate.
- `many` – Whether to validate `data` as a collection. If `None`, the value for `self.many` is used.
- `partial` – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.

**Returns** A dictionary of validation errors.

New in version 1.1.0.

```
class app.serializers.core._SearchValueSerializer(*, only: Optional[Union[Sequence[str], Set[str]]] = None, exclude: Union[Sequence[str], Set[str]] = (), many: bool = False, context: Optional[Dict] = None, load_only: Union[Sequence[str], Set[str]] = (), dump_only: Union[Sequence[str], Set[str]] = (), partial: Union[bool, Sequence[str], Set[str]] = False, unknown: Optional[str] = None)
```

`class Meta`

Options object for a Schema.

Example usage:

```
class Meta:  
    fields = ("id", "email", "date_created")  
    exclude = ("password", "secret_attribute")
```

Available options:

- `fields`: Tuple or list of fields to include in the serialized result.
- `additional`: Tuple or list of fields to include in addition to the explicitly declared fields. `additional` and `fields` are mutually-exclusive options.
- `include`: Dictionary of additional fields to include in the schema. It is usually better to define fields as class variables, but you may need to use this option, e.g., if your fields are Python keywords. May be an `OrderedDict`.

- **exclude:** Tuple or list of fields to exclude in the serialized result. Nested fields can be represented with dot delimiters.
- **dateformat:** Default format for *Date* <fields.Date> fields.
- **datetimeformat:** Default format for *DateTime* <fields.DateTime> fields.
- **timeformat:** Default format for *Time* <fields.Time> fields.
- **render\_module:** Module to use for *loads* <Schema.loads> and *dumps* <Schema.dumps>. Defaults to *json* from the standard library.
- **ordered:** If *True*, order serialization output according to the order in which fields were declared. Output of *Schema.dump* will be a *collections.OrderedDict*.
- **index\_errors:** If *True*, errors dictionaries will include the index of invalid items in a collection.
- **load\_only:** Tuple or list of fields to exclude from serialized results.
- **dump\_only:** Tuple or list of fields to exclude from deserialization
- **unknown:** Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*.
- **register:** Whether to register the Schema with marshmallow's internal class registry. Must be *True* if you intend to refer to this Schema by class name in Nested fields. Only set this to *False* when memory usage is critical. Defaults to *True*.

#### OPTIONS\_CLASS

alias of `marshmallow.schema.SchemaOpts`

```
TYPE_MAPPING = {<class 'str'>: <class 'marshmallow.fields.String'>, <class 'bytes'>: <class 'marshmallow.fields.String'>, <class 'datetime.datetime'>: <class 'marshmallow.fields.DateTime'>, <class 'float'>: <class 'marshmallow.fields.Float'>, <class 'bool'>: <class 'marshmallow.fields.Boolean'>, <class 'tuple'>: <class 'marshmallow.fields.Raw'>, <class 'list'>: <class 'marshmallow.fields.Raw'>, <class 'set'>: <class 'marshmallow.fields.Raw'>, <class 'int'>: <class 'marshmallow.fields.Integer'>, <class 'uuid.UUID'>: <class 'marshmallow.fields.UUID'>, <class 'datetime.time'>: <class 'marshmallow.fields.Time'>, <class 'datetime.date'>: <class 'marshmallow.fields.Date'>, <class 'datetime.timedelta'>: <class 'marshmallow.fields.TimeDelta'>, <class 'decimal.Decimal'>: <class 'marshmallow.fields.Decimal'>}
```

**\_bind\_field**(*field\_name*: str, *field\_obj*: marshmallow.fields.Field) → None

Bind field to the schema, setting any necessary attributes on the field (e.g. parent and name).

Also set field *load\_only* and *dump\_only* values if *field\_name* was specified in class *Meta*.

**static \_call\_and\_store**(*getter\_func*, *data*, \*, *field\_name*, *error\_store*, *index=None*)

Call *getter\_func* with *data* as its argument, and store any *ValidationErrors*.

#### Parameters

- **getter\_func** (*callable*) – Function for getting the serialized/deserialized value from *data*.
- **data** – The data passed to *getter\_func*.
- **field\_name** (str) – Field name.
- **index** (int) – Index of the item being validated, if validating a collection, otherwise *None*.

```
_declared_fields = {'field_name':  
<fields.String(dump_default=<marshmallow.missing>, attribute=None, validate=None,  
required=False, load_only=False, dump_only=False,  
load_default=<marshmallow.missing>, allow_none=False, error_messages={'required':  
'Missing data for required field.', 'null': 'Field may not be null.',  
'validator_failed': 'Invalid value.', 'invalid': 'Not a valid string.',  
'invalid_utf8': 'Not a valid utf-8 string.'}>, 'field_operator':  
<fields.String(dump_default=<marshmallow.missing>, attribute=None,  
validate=<OneOf(choices={'ne', 'in', 'nin', 'gte', 'startswith', 'gt', 'lt', 'eq',  
'lte', 'between', 'contains', 'endswith', 'ncontains'}, labels=[], error='Must be  
one of: {choices}.')>, required=False, load_only=False, dump_only=False,  
load_default=<marshmallow.missing>, allow_none=False, error_messages={'required':  
'Missing data for required field.', 'null': 'Field may not be null.',  
'validator_failed': 'Invalid value.', 'invalid': 'Not a valid string.',  
'invalid_utf8': 'Not a valid utf-8 string.'}>, 'field_value':  
<fields.Raw(dump_default=<marshmallow.missing>, attribute=None, validate=None,  
required=False, load_only=False, dump_only=False,  
load_default=<marshmallow.missing>, allow_none=False, error_messages={'required':  
'Missing data for required field.', 'null': 'Field may not be null.',  
'validator_failed': 'Invalid value.'}>}  
  
_default_error_messages = {'type': 'Invalid input type.', 'unknown': 'Unknown  
field.'}  
  
_deserialize(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, error_store:  
    marshmallow.error_store.ErrorStore, many: bool = False, partial=False, unknown='raise',  
    index=None) → Union[marshmallow.schema._T, List[marshmallow.schema._T]]
```

Deserialize data.

#### Parameters

- **data** (`dict`) – The data to deserialize.
- **error\_store** (`ErrorStore`) – Structure to store errors.
- **many** (`bool`) – *True* if data should be serialized as a collection.
- **partial** (`bool / tuple`) – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*.
- **index** (`int`) – Index of the item being serialized (for storing errors) if serializing a collection, otherwise *None*.

**Returns** A dictionary of the serialized data.

```
_do_load(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, many: Optional[bool] = None,  
    partial: Optional[Union[bool, Sequence[str], Set[str]]] = None, unknown: Optional[str] = None,  
    postprocess: bool = True)
```

Deserialize *data*, returning the serialized result. This method is private API.

#### Parameters

- **data** – The data to deserialize.
- **many** – Whether to deserialize *data* as a collection. If *None*, the value for *self.many* is used.

- **partial** – Whether to validate required fields. If its value is an iterable, only fields listed in that iterable will be ignored will be allowed missing. If *True*, all fields will be allowed missing. If *None*, the value for *self.partial* is used.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.
- **postprocess** – Whether to run post\_load methods..

**Returns** Deserialized data

```
_has_processors(tag) → bool
_hooks = {}
_init_fields() → None
    Update self.fields, self.load_fields, and self.dump_fields based on schema options. This method is private API.
_invoke_dump_processors(tag: str, data, *, many: bool, original_data=None)
_invoke_field_validators(*, error_store: marshmallow.error_store.ErrorStore, data, many: bool)
_invoke_load_processors(tag: str, data, *, many: bool, original_data, partial: Union[bool,
    Sequence[str], Set[str]])
_invoke_processors(tag: str, *, pass_many: bool, data, many: bool, original_data=None, **kwargs)
_invoke_schema_validators(*, error_store: marshmallow.error_store.ErrorStore, pass_many: bool, data,
    original_data, many: bool, partial: Union[bool, Sequence[str], Set[str]], field_errors: bool = False)
_normalize_nested_options() → None
    Apply then flatten nested schema options. This method is private API.
_run_validator(func, output, *, original_data, error_store, many, partial, pass_original,
    index=None)
_serialize(obj: Union[marshmallow.schema._T, Iterable[marshmallow.schema._T]]], *, many: bool =
    False)
    Serialize obj.
```

#### Parameters

- **obj** – The object(s) to serialize.
- **many** (*bool*) – *True* if data should be serialized as a collection.

**Returns** A dictionary of the serialized data

Changed in version 1.0.0: Renamed from `marshal`.

**property dict\_class: type**

```
dump(obj: Any, *, many: Optional[bool] = None)
```

Serialize an object to native Python data types according to this Schema's fields.

#### Parameters

- **obj** – The object to serialize.
- **many** – Whether to serialize *obj* as a collection. If *None*, the value for *self.many* is used.

**Returns** Serialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a (data, errors) tuple. A `ValidationError` is raised if `obj` is invalid.

Changed in version 3.0.0rc9: Validation no longer occurs upon serialization.

**`dumps`(`obj: Any, *args, many: Optional[bool] = None, **kwargs`)**

Same as `dump()`, except return a JSON-encoded string.

#### Parameters

- **obj** – The object to serialize.
- **many** – Whether to serialize `obj` as a collection. If `None`, the value for `self.many` is used.

#### Returns

A json string

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a (data, errors) tuple. A `ValidationError` is raised if `obj` is invalid.

**`error_messages = {}`**

Overrides for default schema-level error messages

#### fields

Dictionary mapping field\_names -> Field objects

**`classmethod from_dict(fields: Dict[str, Union[marshmallow.fields.Field, type]], *, name: str = 'GeneratedSchema') → type`**

Generate a `Schema` class given a dictionary of fields.

```
from marshmallow import Schema, fields

PersonSchema = Schema.from_dict({'name': fields.Str()})
print(PersonSchema().load({'name': 'David'})) # => {'name': 'David'}
```

Generated schemas are not added to the class registry and therefore cannot be referred to by name in `Nested` fields.

#### Parameters

- **fields (dict)** – Dictionary mapping field names to field instances.
- **name (str)** – Optional name for the class, which will appear in the `repr` for the class.

New in version 3.0.0.

**`get_attribute(obj: Any, attr: str, default: Any)`**

Defines how to pull values from an object to serialize.

New in version 2.0.0.

Changed in version 3.0.0a1: Changed position of `obj` and `attr`.

**`handle_error(error: marshmallow.exceptions.ValidationError, data: Any, *, many: bool, **kwargs)`**

Custom error handler function for the schema.

#### Parameters

- **error** – The `ValidationError` raised during (de)serialization.
- **data** – The original input data.
- **many** – Value of `many` on `dump` or `load`.

- **partial** – Value of `partial` on load.

New in version 2.0.0.

Changed in version 3.0.0rc9: Receives `many` and `partial` (on deserialization) as keyword arguments.

### `jsonify(obj, many=<object object>, *args, **kwargs)`

Return a JSON response containing the serialized data.

#### Parameters

- **obj** – Object to serialize.
- **many (bool)** – Whether `obj` should be serialized as an instance or as a collection. If unset, defaults to the value of the `many` attribute on this Schema.
- **kwargs** – Additional keyword arguments passed to `flask.jsonify`.

Changed in version 0.6.0: Takes the same arguments as `marshmallow.Schema.dump`. Additional keyword arguments are passed to `flask.jsonify`.

Changed in version 0.6.3: The `many` argument for this method defaults to the value of the `many` attribute on the Schema. Previously, the `many` argument of this method defaulted to `False`, regardless of the value of `Schema.many`.

### `load(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, many: Optional[bool] = None, partial: Optional[Union[bool, Sequence[str], Set[str]]] = None, unknown: Optional[str] = None)`

Deserialize a data structure to an object defined by this Schema's fields.

#### Parameters

- **data** – The data to deserialize.
- **many** – Whether to deserialize `data` as a collection. If `None`, the value for `self.many` is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use `EXCLUDE`, `INCLUDE` or `RAISE`. If `None`, the value for `self.unknown` is used.

#### Returns Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if invalid data are passed.

### `loads(json_data: str, *, many: Optional[bool] = None, partial: Optional[Union[bool, Sequence[str], Set[str]]] = None, unknown: Optional[str] = None, **kwargs)`

Same as `load()`, except it takes a JSON string as input.

#### Parameters

- **json\_data** – A JSON string of the data to deserialize.
- **many** – Whether to deserialize `obj` as a collection. If `None`, the value for `self.many` is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use `EXCLUDE`, `INCLUDE` or `RAISE`. If `None`, the value for `self.unknown` is used.

**Returns** Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if invalid data are passed.

`on_bind_field(field_name: str, field_obj: marshmallow.fields.Field) → None`

Hook to modify a field when it is bound to the `Schema`.

No-op by default.

`opts = <marshmallow.schema.SchemaOpts object>`

`property set_class: type`

`validate(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, many: Optional[bool] = None, partial: Optional[Union[bool, Sequence[str], Set[str]]] = None) → Dict[str, List[str]]`

Validate `data` against the schema, returning a dictionary of validation errors.

#### Parameters

- `data` – The data to validate.
- `many` – Whether to validate `data` as a collection. If `None`, the value for `self.many` is used.
- `partial` – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.

**Returns** A dictionary of validation errors.

New in version 1.1.0.

## app.serializers.document

### Description

### Classes

---

`DocumentAttachmentSerializer(*[, only, ...])`

---

`DocumentSerializer(*[, only, exclude, many, ...])`

---

**app.serializers.document.DocumentAttachmentSerializer**

```
class app.serializers.document.DocumentAttachmentSerializer(*, only:  
    Optional[Union[Sequence[str],  
Set[str]]] = None, exclude:  
    Union[Sequence[str], Set[str]] = (),  
many: bool = False, context:  
    Optional[Dict] = None, load_only:  
    Union[Sequence[str], Set[str]] = (),  
dump_only: Union[Sequence[str],  
Set[str]] = (), partial: Union[bool,  
Sequence[str], Set[str]] = False,  
unknown: Optional[str] = None)  
Bases: flask_marshmallow.schema.Schema
```

**Attributes**

<i>DocumentAttachmentSerializer.</i>	
<i>TYPE_MAPPING</i>	
<i>DocumentAttachmentSerializer.</i>	
<i>dict_class</i>	
<i>DocumentAttachmentSerializer.</i>	Overrides for default schema-level error mes-
<i>error_messages</i>	sages
<i>DocumentAttachmentSerializer.opts</i>	
<i>DocumentAttachmentSerializer.</i>	
<i>set_class</i>	

**app.serializers.document.DocumentAttachmentSerializer.TYPE\_MAPPING**

```
DocumentAttachmentSerializer.TYPE_MAPPING = {<class 'str'>: <class  
'marshmallow.fields.String'>, <class 'bytes'>: <class  
'marshmallow.fields.String'>, <class 'datetime.datetime'>: <class  
'marshmallow.fields.DateTime'>, <class 'float'>: <class  
'marshmallow.fields.Float'>, <class 'bool'>: <class  
'marshmallow.fields.Boolean'>, <class 'tuple'>: <class  
'marshmallow.fields.Raw'>, <class 'list'>: <class

<class 'int'>: <class 'marshmallow.fields.Integer'>, <class 'uuid.UUID'>:  
<class 'marshmallow.fields.UUID'>, <class 'datetime.time'>: <class  
'marshmallow.fields.Time'>, <class 'datetime.date'>: <class  
'marshmallow.fields.Date'>, <class 'datetime.timedelta'>: <class  
'marshmallow.fields.Timedelta'>, <class 'decimal.Decimal'>: <class  
'marshmallow.fields.Decimal'>}
```

`app.serializers.document.DocumentAttachmentSerializer.dict_class`

`property DocumentAttachmentSerializer.dict_class: type`

`app.serializers.document.DocumentAttachmentSerializer.error_messages`

`DocumentAttachmentSerializer.error_messages = {}`

Overrides for default schema-level error messages

`app.serializers.document.DocumentAttachmentSerializer.opts`

`DocumentAttachmentSerializer.opts = <marshmallow.schema.SchemaOpts object>`

`app.serializers.document.DocumentAttachmentSerializer.set_class`

`property DocumentAttachmentSerializer.set_class: type`

## Methods

---

`DocumentAttachmentSerializer.`

`__init__(*[, ...])`

`DocumentAttachmentSerializer.dump(obj, *[, many])` Serialize an object to native Python data types according to this Schema's fields.

`DocumentAttachmentSerializer.dumps(obj, *args)` Same as `dump()`, except return a JSON-encoded string.

`DocumentAttachmentSerializer.from_dict(fields, *)` Generate a *Schema* class given a dictionary of fields.

`DocumentAttachmentSerializer.get_attribute(...)` Defines how to pull values from an object to serialize.

`DocumentAttachmentSerializer.handle_error(...)` Custom error handler function for the schema.

`DocumentAttachmentSerializer.jsonify(obj[, many])` Return a JSON response containing the serialized data.

`DocumentAttachmentSerializer.load(data, *[, ...])` Deserialize a data structure to an object defined by this Schema's fields.

`DocumentAttachmentSerializer.loads(json_data, *)` Same as `load()`, except it takes a JSON string as input.

`DocumentAttachmentSerializer.on_bind_field(...)` Hook to modify a field when it is bound to the *Schema*.

`DocumentAttachmentSerializer.process_input(...)`

`DocumentAttachmentSerializer.validate(data, *)` Validate *data* against the schema, returning a dictionary of validation errors.

---

### app.serializers.document.DocumentAttachmentSerializer.\_\_init\_\_

```
DocumentAttachmentSerializer.__init__(*, only: Optional[Union[Sequence[str], Set[str]]] = None, exclude: Union[Sequence[str], Set[str]] = (), many: bool = False, context: Optional[Dict] = None, load_only: Union[Sequence[str], Set[str]] = (), dump_only: Union[Sequence[str], Set[str]] = (), partial: Union[bool, Sequence[str], Set[str]] = False, unknown: Optional[str] = None)
```

### app.serializers.document.DocumentAttachmentSerializer.dump

```
DocumentAttachmentSerializer.dump(obj: Any, *, many: Optional[bool] = None)
```

Serialize an object to native Python data types according to this Schema's fields.

#### Parameters

- **obj** – The object to serialize.
- **many** – Whether to serialize *obj* as a collection. If *None*, the value for *self.many* is used.

#### Returns

Serialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if *obj* is invalid.

Changed in version 3.0.0rc9: Validation no longer occurs upon serialization.

### app.serializers.document.DocumentAttachmentSerializer.dumps

```
DocumentAttachmentSerializer.dumps(obj: Any, *args, many: Optional[bool] = None, **kwargs)
```

Same as `dump()`, except return a JSON-encoded string.

#### Parameters

- **obj** – The object to serialize.
- **many** – Whether to serialize *obj* as a collection. If *None*, the value for *self.many* is used.

#### Returns

A json string

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if *obj* is invalid.

### app.serializers.document.DocumentAttachmentSerializer.from\_dict

```
classmethod DocumentAttachmentSerializer.from_dict(fields: Dict[str, Union[marshmallow.fields.Field, type]], *, name: str = 'GeneratedSchema') → type
```

Generate a *Schema* class given a dictionary of fields.

```
from marshmallow import Schema, fields

PersonSchema = Schema.from_dict({"name": fields.Str()})
print(PersonSchema().load({"name": "David"})) # => {'name': 'David'}
```

Generated schemas are not added to the class registry and therefore cannot be referred to by name in *Nested* fields.

**Parameters**

- **fields** (*dict*) – Dictionary mapping field names to field instances.
- **name** (*str*) – Optional name for the class, which will appear in the `repr` for the class.

New in version 3.0.0.

### `app.serializers.document.DocumentAttachmentSerializer.get_attribute`

`DocumentAttachmentSerializer.get_attribute(obj: Any, attr: str, default: Any)`

Defines how to pull values from an object to serialize.

New in version 2.0.0.

Changed in version 3.0.0a1: Changed position of `obj` and `attr`.

### `app.serializers.document.DocumentAttachmentSerializer.handle_error`

`DocumentAttachmentSerializer.handle_error(error:`

*marshmallow.exceptions.ValidationError,*  
*data: Any, \*, many: bool, \*\*kwargs)*

Custom error handler function for the schema.

**Parameters**

- **error** – The `ValidationError` raised during (de)serialization.
- **data** – The original input data.
- **many** – Value of `many` on dump or load.
- **partial** – Value of `partial` on load.

New in version 2.0.0.

Changed in version 3.0.0rc9: Receives `many` and `partial` (on deserialization) as keyword arguments.

### `app.serializers.document.DocumentAttachmentSerializer.jsonify`

`DocumentAttachmentSerializer.jsonify(obj, many=<object object>, *args, **kwargs)`

Return a JSON response containing the serialized data.

**Parameters**

- **obj** – Object to serialize.
- **many** (*bool*) – Whether `obj` should be serialized as an instance or as a collection.  
If unset, defaults to the value of the `many` attribute on this Schema.
- **kwargs** – Additional keyword arguments passed to `flask.jsonify`.

Changed in version 0.6.0: Takes the same arguments as `marshmallow.Schema.dump`. Additional keyword arguments are passed to `flask.jsonify`.

Changed in version 0.6.3: The `many` argument for this method defaults to the value of the `many` attribute on the Schema. Previously, the `many` argument of this method defaulted to False, regardless of the value of `Schema.many`.

## app.serializers.document.DocumentAttachmentSerializer.load

```
DocumentAttachmentSerializer.load(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, many: Optional[bool] = None, partial: Optional[Union[bool, Sequence[str], Set[str]]] = None, unknown: Optional[str] = None)
```

Deserialize a data structure to an object defined by this Schema's fields.

### Parameters

- **data** – The data to deserialize.
- **many** – Whether to deserialize *data* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.

### Returns

Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if invalid data are passed.

## app.serializers.document.DocumentAttachmentSerializer.loads

```
DocumentAttachmentSerializer.loads(json_data: str, *, many: Optional[bool] = None, partial: Optional[Union[bool, Sequence[str], Set[str]]] = None, unknown: Optional[str] = None, **kwargs)
```

Same as `load()`, except it takes a JSON string as input.

### Parameters

- **json\_data** – A JSON string of the data to deserialize.
- **many** – Whether to deserialize *obj* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.

### Returns

Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if invalid data are passed.

**app.serializers.document.DocumentAttachmentSerializer.on\_bind\_field**

```
DocumentAttachmentSerializer.on_bind_field(field_name: str, field_obj:  
    marshmallow.fields.Field) → None
```

Hook to modify a field when it is bound to the *Schema*.

No-op by default.

**app.serializers.document.DocumentAttachmentSerializer.process\_input**

```
DocumentAttachmentSerializer.process_input(value, many, **kwargs)
```

**app.serializers.document.DocumentAttachmentSerializer.validate**

```
DocumentAttachmentSerializer.validate(data: Union[Mapping[str, Any],  
    Iterable[Mapping[str, Any]]], *, many:  
    Optional[bool] = None, partial:  
    Optional[Union[bool, Sequence[str], Set[str]]] =  
    None) → Dict[str, List[str]]
```

Validate *data* against the schema, returning a dictionary of validation errors.

**Parameters**

- **data** – The data to validate.
- **many** – Whether to validate *data* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.

**Returns** A dictionary of validation errors.

New in version 1.1.0.

**app.serializers.document.DocumentSerializer**

```
class app.serializers.document.DocumentSerializer(*, only: Optional[Union[Sequence[str], Set[str]]]  
    = None, exclude: Union[Sequence[str], Set[str]] = (), many: bool = False, context: Optional[Dict] =  
    None, load_only: Union[Sequence[str], Set[str]] = (), dump_only: Union[Sequence[str], Set[str]] = (),  
    partial: Union[bool, Sequence[str], Set[str]] = False, unknown: Optional[str] = None)
```

Bases: `flask_marshmallow.schema.Schema`

## Attributes

**app.serializers.document.DocumentSerializer.\_\_init\_\_**

```
DocumentSerializer.__init__(*, only: Optional[Union[Sequence[str], Set[str]]] = None,  
                           exclude: Union[Sequence[str], Set[str]] = (), many: bool =  
                           False, context: Optional[Dict] = None, load_only:  
                           Union[Sequence[str], Set[str]] = (), dump_only:  
                           Union[Sequence[str], Set[str]] = (), partial: Union[bool,  
                           Sequence[str], Set[str]] = False, unknown: Optional[str] =  
                           None)
```

## app.serializers.document.DocumentSerializer.dump

`DocumentSerializer.dump(obj: Any, *, many: Optional[bool] = None)`

Serialize an object to native Python data types according to this Schema's fields.

### Parameters

- **obj** – The object to serialize.
- **many** – Whether to serialize *obj* as a collection. If *None*, the value for *self.many* is used.

### Returns

Serialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if *obj* is invalid.

Changed in version 3.0.0rc9: Validation no longer occurs upon serialization.

## app.serializers.document.DocumentSerializer.dumps

`DocumentSerializer.dumps(obj: Any, *args, many: Optional[bool] = None, **kwargs)`

Same as `dump()`, except return a JSON-encoded string.

### Parameters

- **obj** – The object to serialize.
- **many** – Whether to serialize *obj* as a collection. If *None*, the value for *self.many* is used.

### Returns

A json string

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if *obj* is invalid.

## app.serializers.document.DocumentSerializer.from\_dict

`classmethod DocumentSerializer.from_dict(fields: Dict[str, Union[marshmallow.fields.Field, type]], *, name: str = 'GeneratedSchema') → type`

Generate a *Schema* class given a dictionary of fields.

```
from marshmallow import Schema, fields

PersonSchema = Schema.from_dict({"name": fields.Str()})
print(PersonSchema().load({"name": "David"})) # => {'name': 'David'}
```

Generated schemas are not added to the class registry and therefore cannot be referred to by name in *Nested* fields.

### Parameters

- **fields** (*dict*) – Dictionary mapping field names to field instances.
- **name** (*str*) – Optional name for the class, which will appear in the `repr` for the class.

New in version 3.0.0.

**app.serializers.document.DocumentSerializer.get\_attribute****DocumentSerializer.get\_attribute**(*obj: Any, attr: str, default: Any*)

Defines how to pull values from an object to serialize.

New in version 2.0.0.

Changed in version 3.0.0a1: Changed position of `obj` and `attr`.

**app.serializers.document.DocumentSerializer.handle\_error****DocumentSerializer.handle\_error**(*error: marshmallow.exceptions.ValidationError, data: Any, \*, many: bool, \*\*kwargs*)

Custom error handler function for the schema.

**Parameters**

- **error** – The `ValidationError` raised during (de)serialization.
- **data** – The original input data.
- **many** – Value of `many` on dump or load.
- **partial** – Value of `partial` on load.

New in version 2.0.0.

Changed in version 3.0.0rc9: Receives `many` and `partial` (on deserialization) as keyword arguments.

**app.serializers.document.DocumentSerializer.jsonify****DocumentSerializer.jsonify**(*obj, many=<object object>, \*args, \*\*kwargs*)

Return a JSON response containing the serialized data.

**Parameters**

- **obj** – Object to serialize.
- **many** (`bool`) – Whether `obj` should be serialized as an instance or as a collection.  
If unset, defaults to the value of the `many` attribute on this Schema.
- **kwargs** – Additional keyword arguments passed to `flask.jsonify`.

Changed in version 0.6.0: Takes the same arguments as `marshmallow.Schema.dump`. Additional keyword arguments are passed to `flask.jsonify`.

Changed in version 0.6.3: The `many` argument for this method defaults to the value of the `many` attribute on the Schema. Previously, the `many` argument of this method defaulted to `False`, regardless of the value of `Schema.many`.

**app.serializers.document.DocumentSerializer.load****DocumentSerializer.load**(*data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], \*, many: Optional[bool] = None, partial: Optional[Union[bool, Sequence[str], Set[str]]] = None, unknown: Optional[str] = None*)

Deserialize a data structure to an object defined by this Schema's fields.

**Parameters**

- **data** – The data to deserialize.
- **many** – Whether to deserialize `data` as a collection. If `None`, the value for `self.many` is used.
- **partial** – Whether to ignore missing fields and not require any fields declared.  
Propagates down to `Nested` fields as well. If its value is an iterable, only missing

fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.

- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.

**Returns** Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if invalid data are passed.

### app.serializers.document.DocumentSerializer.loads

```
DocumentSerializer.loads(json_data: str, *, many: Optional[bool] = None, partial:  
    Optional[Union[bool, Sequence[str], Set[str]]] = None, unknown:  
    Optional[str] = None, **kwargs)
```

Same as `load()`, except it takes a JSON string as input.

#### Parameters

- **json\_data** – A JSON string of the data to deserialize.
- **many** – Whether to deserialize *obj* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.

**Returns** Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if invalid data are passed.

### app.serializers.document.DocumentSerializer.on\_bind\_field

```
DocumentSerializer.on_bind_field(field_name: str, field_obj: marshmallow.fields.Field) →  
    None
```

Hook to modify a field when it is bound to the *Schema*.

No-op by default.

### app.serializers.document.DocumentSerializer.valid\_request\_file

```
static DocumentSerializer.valid_request_file(data)
```

**app.serializers.document.DocumentSerializer.validate**

```
DocumentSerializer.validate(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]],  
                           *, many: Optional[bool] = None, partial:  
                           Optional[Union[bool, Sequence[str], Set[str]]] = None) →  
                           Dict[str, List[str]]
```

Validate *data* against the schema, returning a dictionary of validation errors.

**Parameters**

- **data** – The data to validate.
- **many** – Whether to validate *data* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.

**Returns** A dictionary of validation errors.

New in version 1.1.0.

**app.serializers.document.DocumentSerializer.validate\_id**

```
DocumentSerializer.validate_id(document_id)
```

**app.serializers.document.DocumentSerializer.wrap**

```
DocumentSerializer.wrap(data, **kwargs)
```

```
class app.serializers.document.DocumentAttachmentSerializer(*, only:  
                                                               Optional[Union[Sequence[str],  
                                                               Set[str]]] = None, exclude:  
                                                               Union[Sequence[str], Set[str]] = (),  
                                                               many: bool = False, context:  
                                                               Optional[Dict] = None, load_only:  
                                                               Union[Sequence[str], Set[str]] = (),  
                                                               dump_only: Union[Sequence[str],  
                                                               Set[str]] = (), partial: Union[bool,  
                                                               Sequence[str], Set[str]] = False,  
                                                               unknown: Optional[str] = None)
```

**class Meta**

Options object for a Schema.

Example usage:

```
class Meta:  
    fields = ("id", "email", "date_created")  
    exclude = ("password", "secret_attribute")
```

Available options:

- **fields**: Tuple or list of fields to include in the serialized result.
- **additional**: Tuple or list of fields to include in addition to the explicitly declared fields. additional and fields are mutually-exclusive options.

- **include:** Dictionary of additional fields to include in the schema. It is usually better to define fields as class variables, but you may need to use this option, e.g., if your fields are Python keywords. May be an *OrderedDict*.
- **exclude:** Tuple or list of fields to exclude in the serialized result. Nested fields can be represented with dot delimiters.
- **dateformat:** Default format for *Date* <fields.Date> fields.
- **datetimeformat:** Default format for *DateTime* <fields.DateTime> fields.
- **timeformat:** Default format for *Time* <fields.Time> fields.
- **render\_module:** Module to use for *loads* <Schema.loads> and *dumps* <Schema.dumps>. Defaults to *json* from the standard library.
- **ordered:** If *True*, order serialization output according to the order in which fields were declared. Output of *Schema.dump* will be a *collections.OrderedDict*.
- **index\_errors:** If *True*, errors dictionaries will include the index of invalid items in a collection.
- **load\_only:** Tuple or list of fields to exclude from serialized results.
- **dump\_only:** Tuple or list of fields to exclude from deserialization
- **unknown:** Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*.
- **register:** Whether to register the *Schema* with marshmallow's internal class registry. Must be *True* if you intend to refer to this *Schema* by class name in *Nested* fields. Only set this to *False* when memory usage is critical. Defaults to *True*.

#### OPTIONS\_CLASS

alias of `marshmallow.schema.SchemaOpts`

```
TYPE_MAPPING = {<class 'str'>: <class 'marshmallow.fields.String'>, <class 'bytes'>: <class 'marshmallow.fields.String'>, <class 'datetime.datetime'>: <class 'marshmallow.fields.DateTime'>, <class 'float'>: <class 'marshmallow.fields.Float'>, <class 'bool'>: <class 'marshmallow.fields.Boolean'>, <class 'tuple'>: <class 'marshmallow.fields.Raw'>, <class 'list'>: <class 'marshmallow.fields.Raw'>, <class 'set'>: <class 'marshmallow.fields.Raw'>, <class 'int'>: <class 'marshmallow.fields.Integer'>, <class 'uuid.UUID'>: <class 'marshmallow.fields.UUID'>, <class 'datetime.time'>: <class 'marshmallow.fields.Time'>, <class 'datetime.date'>: <class 'marshmallow.fields.Date'>, <class 'datetime.timedelta'>: <class 'marshmallow.fields.TimeDelta'>, <class 'decimal.Decimal'>: <class 'marshmallow.fields.Decimal'>}
```

`_bind_field(field_name: str, field_obj: marshmallow.fields.Field)` → None

Bind field to the schema, setting any necessary attributes on the field (e.g. parent and name).

Also set field `load_only` and `dump_only` values if `field_name` was specified in class `Meta`.

`static _call_and_store(getter_func, data, *, field_name, error_store, index=None)`

Call `getter_func` with `data` as its argument, and store any `ValidationErrors`.

#### Parameters

- **getter\_func** (*callable*) – Function for getting the serialized/deserialized value from `data`.
- **data** – The data passed to `getter_func`.
- **field\_name** (*str*) – Field name.

- **index** (*int*) – Index of the item being validated, if validating a collection, otherwise *None*.

```
_declared_fields = {'as_attachment':  
<fields.Integer(dump_default=<marshmallow.missing>, attribute=None,  
validate=<OneOf(choices=[1, 0], labels=[], error='Must be one of: {choices}.')>,  
required=False, load_only=False, dump_only=False,  
load_default=<marshmallow.missing>, allow_none=False, error_messages={'required':  
'Missing data for required field.', 'null': 'Field may not be null.',  
'validator_failed': 'Invalid value.', 'invalid': 'Not a valid integer.',  
'too_large': 'Number too large.'})>}  
  
_default_error_messages = {'type': 'Invalid input type.', 'unknown': 'Unknown  
field.'}  
  
_deserialize(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, error_store:  
    marshmallow.error_store.ErrorStore, many: bool = False, partial=False, unknown='raise',  
    index=None) → Union[marshmallow.schema._T, List[marshmallow.schema._T]]
```

Deserialize data.

#### Parameters

- **data** (*dict*) – The data to deserialize.
- **error\_store** (*ErrorStore*) – Structure to store errors.
- **many** (*bool*) – *True* if *data* should be serialized as a collection.
- **partial** (*bool / tuple*) – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*.
- **index** (*int*) – Index of the item being serialized (for storing errors) if serializing a collection, otherwise *None*.

**Returns** A dictionary of the serialized data.

```
_do_load(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, many: Optional[bool] = None,  
    partial: Optional[Union[bool, Sequence[str], Set[str]]] = None, unknown: Optional[str] = None,  
    postprocess: bool = True)
```

Deserialize *data*, returning the serialized result. This method is private API.

#### Parameters

- **data** – The data to deserialize.
- **many** – Whether to deserialize *data* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to validate required fields. If its value is an iterable, only fields listed in that iterable will be allowed missing. If *True*, all fields will be allowed missing. If *None*, the value for *self.partial* is used.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.
- **postprocess** – Whether to run post\_load methods..

**Returns** Deserialized data

```
_has_processors(tag) → bool  
  
_hooks = {('pre_load', False): ['process_input']}
```

`_init_fields()` → None  
Update self.fields, self.load\_fields, and self.dump\_fields based on schema options. This method is private API.

`_invoke_dump_processors(tag: str, data, *, many: bool, original_data=None)`

`_invoke_field_validators(*, error_store: marshmallow.error_store.ErrorStore, data, many: bool)`

`_invoke_load_processors(tag: str, data, *, many: bool, original_data, partial: Union[bool, Sequence[str], Set[str]])`

`_invoke_processors(tag: str, *, pass_many: bool, data, many: bool, original_data=None, **kwargs)`

`_invoke_schema_validators(*, error_store: marshmallow.error_store.ErrorStore, pass_many: bool, data, original_data, many: bool, partial: Union[bool, Sequence[str], Set[str]], field_errors: bool = False)`

`_normalize_nested_options()` → None  
Apply then flatten nested schema options. This method is private API.

`_run_validator(serializer_func, output, *, original_data, error_store, many, partial, pass_original, index=None)`

`_serialize(obj: Union[marshmallow.schema._T, Iterable[marshmallow.schema._T]], *, many: bool = False)`  
Serialize obj.

#### Parameters

- **obj** – The object(s) to serialize.
- **many** (*bool*) – *True* if data should be serialized as a collection.

#### Returns

A dictionary of the serialized data

Changed in version 1.0.0: Renamed from `marshal`.

`property dict_class: type`

`dump(obj: Any, *, many: Optional[bool] = None)`

Serialize an object to native Python data types according to this Schema's fields.

#### Parameters

- **obj** – The object to serialize.
- **many** – Whether to serialize *obj* as a collection. If *None*, the value for *self.many* is used.

#### Returns

Serialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if *obj* is invalid.

Changed in version 3.0.0rc9: Validation no longer occurs upon serialization.

`dumps(obj: Any, *args, many: Optional[bool] = None, **kwargs)`

Same as `dump()`, except return a JSON-encoded string.

#### Parameters

- **obj** – The object to serialize.
- **many** – Whether to serialize *obj* as a collection. If *None*, the value for *self.many* is used.

#### Returns

A json string

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if `obj` is invalid.

**error\_messages = {}**

Overrides for default schema-level error messages

**fields**

Dictionary mapping field\_names -> Field objects

**classmethod from\_dict(fields: Dict[str, Union[marshmallow.fields.Field, type]], \*, name: str = 'GeneratedSchema') → type**

Generate a `Schema` class given a dictionary of fields.

```
from marshmallow import Schema, fields

PersonSchema = Schema.from_dict({"name": fields.Str()})
print(PersonSchema().load({"name": "David"})) # => {'name': 'David'}
```

Generated schemas are not added to the class registry and therefore cannot be referred to by name in `Nested` fields.

**Parameters**

- **fields (dict)** – Dictionary mapping field names to field instances.
- **name (str)** – Optional name for the class, which will appear in the `repr` for the class.

New in version 3.0.0.

**get\_attribute(obj: Any, attr: str, default: Any)**

Defines how to pull values from an object to serialize.

New in version 2.0.0.

Changed in version 3.0.0a1: Changed position of `obj` and `attr`.

**handle\_error(error: marshmallow.exceptions.ValidationError, data: Any, \*, many: bool, \*\*kwargs)**

Custom error handler function for the schema.

**Parameters**

- **error** – The `ValidationError` raised during (de)serialization.
- **data** – The original input data.
- **many** – Value of `many` on dump or load.
- **partial** – Value of `partial` on load.

New in version 2.0.0.

Changed in version 3.0.0rc9: Receives `many` and `partial` (on deserialization) as keyword arguments.

**jsonify(obj, many=<object object>, \*args, \*\*kwargs)**

Return a JSON response containing the serialized data.

**Parameters**

- **obj** – Object to serialize.
- **many (bool)** – Whether `obj` should be serialized as an instance or as a collection. If unset, defaults to the value of the `many` attribute on this `Schema`.
- **kwargs** – Additional keyword arguments passed to `flask.jsonify`.

Changed in version 0.6.0: Takes the same arguments as `marshmallow.Schema.dump`. Additional keyword arguments are passed to `flask.jsonify`.

Changed in version 0.6.3: The `many` argument for this method defaults to the value of the `many` attribute on the Schema. Previously, the `many` argument of this method defaulted to False, regardless of the value of `Schema.many`.

**load**(*data*: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], \*, *many*: Optional[bool] = None, *partial*: Optional[Union[bool, Sequence[str], Set[str]]] = None, *unknown*: Optional[str] = None)  
Deserialize a data structure to an object defined by this Schema's fields.

#### Parameters

- **data** – The data to deserialize.
- **many** – Whether to deserialize *data* as a collection. If *None*, the value for `self.many` is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use `EXCLUDE`, `INCLUDE` or `RAISE`. If *None*, the value for `self.unknown` is used.

#### Returns Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if invalid data are passed.

**loads**(*json\_data*: str, \*, *many*: Optional[bool] = None, *partial*: Optional[Union[bool, Sequence[str], Set[str]]] = None, *unknown*: Optional[str] = None, \*\**kwargs*)  
Same as [load\(\)](#), except it takes a JSON string as input.

#### Parameters

- **json\_data** – A JSON string of the data to deserialize.
- **many** – Whether to deserialize *obj* as a collection. If *None*, the value for `self.many` is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use `EXCLUDE`, `INCLUDE` or `RAISE`. If *None*, the value for `self.unknown` is used.

#### Returns Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if invalid data are passed.

**on\_bind\_field**(*field\_name*: str, *field\_obj*: marshmallow.fields.Field) → None

Hook to modify a field when it is bound to the Schema.

No-op by default.

```
opts = <marshmallow.schema.SchemaOpts object>
process_input(value, many, **kwargs)
property set_class: type
```

```
validate(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, many: Optional[bool] = None,
         partial: Optional[Union[bool, Sequence[str], Set[str]]] = None) → Dict[str, List[str]]
```

Validate *data* against the schema, returning a dictionary of validation errors.

#### Parameters

- **data** – The data to validate.
- **many** – Whether to validate *data* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.

**Returns** A dictionary of validation errors.

New in version 1.1.0.

```
class app.serializers.document.DocumentSerializer(*, only: Optional[Union[Sequence[str], Set[str]]] =
                                                = None, exclude: Union[Sequence[str], Set[str]] =
                                                (), many: bool = False, context: Optional[Dict] =
                                                None, load_only: Union[Sequence[str], Set[str]] =
                                                (), dump_only: Union[Sequence[str], Set[str]] = (),
                                                partial: Union[bool, Sequence[str], Set[str]] =
                                                False, unknown: Optional[str] = None)
```

```
class Meta
```

```
    ordered = True
```

```
OPTIONS_CLASS
```

```
    alias of marshmallow.schema.SchemaOpts
```

```
TYPE_MAPPING = {<class 'str'>: <class 'marshmallow.fields.String'>, <class
'bytes': <class 'marshmallow.fields.String'>, <class 'datetime.datetime': <class
'marshmallow.fields.DateTime'>, <class 'float': <class
'marshmallow.fields.Float'>, <class 'bool': <class 'marshmallow.fields.Boolean'>,
<class 'tuple': <class 'marshmallow.fields.Raw'>, <class 'list': <class
'marshmallow.fields.Raw'>, <class 'set': <class 'marshmallow.fields.Raw'>, <class
'int': <class 'marshmallow.fields.Integer'>, <class 'uuid.UUID': <class

'marshmallow.fields.Decimal'>}
```

```
_bind_field(field_name: str, field_obj: marshmallow.fields.Field) → None
```

Bind field to the schema, setting any necessary attributes on the field (e.g. parent and name).

Also set field `load_only` and `dump_only` values if `field_name` was specified in class `Meta`.

```
static _call_and_store(getter_func, data, *, field_name, error_store, index=None)
```

Call `getter_func` with `data` as its argument, and store any `ValidationErrors`.

#### Parameters

- **getter\_func** (*callable*) – Function for getting the serialized/deserialized value from *data*.
- **data** – The data passed to `getter_func`.

- **field\_name** (*str*) – Field name.
- **index** (*int*) – Index of the item being validated, if validating a collection, otherwise *None*.

```
_declared_fields = {'created_at':

'too_large': 'Number too large.'})>, 'updated_at':  
<fields.TimestampField(dump_default=<marshmallow.missing>, attribute=None,  
validate=None, required=False, load_only=False, dump_only=True,  
load_default=<marshmallow.missing>, allow_none=False, error_messages={'required':  
'Missing data for required field.', 'null': 'Field may not be null.',  
'validator_failed': 'Invalid value.'})>}
```

```
_default_error_messages = {'type': 'Invalid input type.', 'unknown': 'Unknown field.'}

_deserialize(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, error_store:
    marshmallow.error_store.ErrorStore, many: bool = False, partial=False, unknown='raise',
    index=None) → Union[marshmallow.schema._T, List[marshmallow.schema._T]]
```

Deserialize data.

#### Parameters

- **data** (*dict*) – The data to deserialize.
- **error\_store** (*ErrorStore*) – Structure to store errors.
- **many** (*bool*) – *True* if data should be serialized as a collection.
- **partial** (*bool / tuple*) – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*.
- **index** (*int*) – Index of the item being serialized (for storing errors) if serializing a collection, otherwise *None*.

**Returns** A dictionary of the serialized data.

```
_do_load(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, many: Optional[bool] = None,
    partial: Optional[Union[bool, Sequence[str], Set[str]]] = None, unknown: Optional[str] = None,
    postprocess: bool = True)
```

Deserialize *data*, returning the serialized result. This method is private API.

#### Parameters

- **data** – The data to deserialize.
- **many** – Whether to deserialize *data* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to validate required fields. If its value is an iterable, only fields listed in that iterable will be allowed missing. If *True*, all fields will be allowed missing. If *None*, the value for *self.partial* is used.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.
- **postprocess** – Whether to run post\_load methods..

**Returns** Deserialized data

```
_has_processors(tag) → bool

_hooks = defaultdict(<class 'list'>, {'validates': ['validate_id'], ('post_dump',
False): ['wrap']})
```

```
_init_fields() → None
```

Update *self.fields*, *self.load\_fields*, and *self.dump\_fields* based on schema options. This method is private API.

```
_invoke_dump_processors(tag: str, data, *, many: bool, original_data=None)
```

```
_invoke_field_validators(*, error_store: marshmallow.error_store.ErrorStore, data, many: bool)
```

```
_invoke_load_processors(tag: str, data, *, many: bool, original_data, partial: Union[bool,
    Sequence[str], Set[str]])
```

```
_invoke_processors(tag: str, *, pass_many: bool, data, many: bool, original_data=None, **kwargs)
_invoke_schema_validators(*, error_store: marshmallow.error_store.ErrorStore, pass_many: bool, data,
                           original_data, many: bool, partial: Union[bool, Sequence[str], Set[str]],
                           field_errors: bool = False)
_normalize_nested_options() → None
    Apply then flatten nested schema options. This method is private API.
_run_validator(func, output, *, original_data, error_store, many, partial, pass_original,
               index=None)
_serialize(obj: Union[marshmallow.schema._T, Iterable[marshmallow.schema._T]], *, many: bool =
            False)
    Serialize obj.
```

#### Parameters

- **obj** – The object(s) to serialize.
- **many** (*bool*) – *True* if data should be serialized as a collection.

#### Returns

A dictionary of the serialized data

Changed in version 1.0.0: Renamed from `marshal`.

### **property dict\_class: type**

```
dump(obj: Any, *, many: Optional[bool] = None)
```

Serialize an object to native Python data types according to this Schema's fields.

#### Parameters

- **obj** – The object to serialize.
- **many** – Whether to serialize *obj* as a collection. If *None*, the value for *self.many* is used.

#### Returns

Serialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if *obj* is invalid.

Changed in version 3.0.0rc9: Validation no longer occurs upon serialization.

```
dumps(obj: Any, *args, many: Optional[bool] = None, **kwargs)
```

Same as `dump()`, except return a JSON-encoded string.

#### Parameters

- **obj** – The object to serialize.
- **many** – Whether to serialize *obj* as a collection. If *None*, the value for *self.many* is used.

#### Returns

A json string

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if *obj* is invalid.

```
error_messages = {}
```

Overrides for default schema-level error messages

### **fields**

Dictionary mapping field\_names -> Field objects

---

**classmethod from\_dict**(*fields: Dict[str, Union[marshmallow.fields.Field, type]]*, \*, *name: str = 'GeneratedSchema'*) → *type*

Generate a *Schema* class given a dictionary of fields.

```
from marshmallow import Schema, fields

PersonSchema = Schema.from_dict({"name": fields.Str()})
print(PersonSchema().load({"name": "David"})) # => {'name': 'David'}
```

Generated schemas are not added to the class registry and therefore cannot be referred to by name in *Nested* fields.

#### Parameters

- **fields** (*dict*) – Dictionary mapping field names to field instances.
- **name** (*str*) – Optional name for the class, which will appear in the *repr* for the class.

New in version 3.0.0.

**get\_attribute**(*obj: Any, attr: str, default: Any*)

Defines how to pull values from an object to serialize.

New in version 2.0.0.

Changed in version 3.0.0a1: Changed position of *obj* and *attr*.

**handle\_error**(*error: marshmallow.exceptions.ValidationError, data: Any, \*, many: bool, \*\*kwargs*)

Custom error handler function for the schema.

#### Parameters

- **error** – The *ValidationError* raised during (de)serialization.
- **data** – The original input data.
- **many** – Value of *many* on dump or load.
- **partial** – Value of *partial* on load.

New in version 2.0.0.

Changed in version 3.0.0rc9: Receives *many* and *partial* (on deserialization) as keyword arguments.

**jsonify**(*obj, many=<object object>, \*args, \*\*kwargs*)

Return a JSON response containing the serialized data.

#### Parameters

- **obj** – Object to serialize.
- **many** (*bool*) – Whether *obj* should be serialized as an instance or as a collection. If unset, defaults to the value of the *many* attribute on this Schema.
- **kwargs** – Additional keyword arguments passed to *flask.jsonify*.

Changed in version 0.6.0: Takes the same arguments as *marshmallow.Schema.dump*. Additional keyword arguments are passed to *flask.jsonify*.

Changed in version 0.6.3: The *many* argument for this method defaults to the value of the *many* attribute on the Schema. Previously, the *many* argument of this method defaulted to False, regardless of the value of *Schema.many*.

**load**(*data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]]*, \*, *many: Optional[bool] = None, partial: Optional[Union[bool, Sequence[str], Set[str]]] = None, unknown: Optional[str] = None*)

Deserialize a data structure to an object defined by this Schema's fields.

## Parameters

- **data** – The data to deserialize.
- **many** – Whether to deserialize *data* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.

## Returns

Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if invalid data are passed.

**loads**(*json\_data*: str, \*, *many*: Optional[bool] = *None*, *partial*: Optional[Union[bool, Sequence[str], Set[str]]] = *None*, *unknown*: Optional[str] = *None*, \*\**kwargs*)  
Same as [load\(\)](#), except it takes a JSON string as input.

## Parameters

- **json\_data** – A JSON string of the data to deserialize.
- **many** – Whether to deserialize *obj* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.

## Returns

Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if invalid data are passed.

**on\_bind\_field**(*field\_name*: str, *field\_obj*: marshmallow.fields.Field) → *None*  
Hook to modify a field when it is bound to the *Schema*.  
No-op by default.  
**opts** = <marshmallow.schema.SchemaOpts object>  
**property** *set\_class*: type  
**static** *valid\_request\_file*(*data*)  
**validate**(*data*: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], \*, *many*: Optional[bool] = *None*, *partial*: Optional[Union[bool, Sequence[str], Set[str]]] = *None*) → Dict[str, List[str]]  
Validate *data* against the schema, returning a dictionary of validation errors.

## Parameters

- **data** – The data to validate.
- **many** – Whether to validate *data* as a collection. If *None*, the value for *self.many* is used.

- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.

**Returns** A dictionary of validation errors.

New in version 1.1.0.

**validate\_id**(*document\_id*)

**wrap**(*data*, \*\**kwargs*)

## app.serializers.role

### Description

### Classes

---

**RoleName**(\**, load\_default*, *missing*, ...)

---

**RoleSerializer**(\*[, *only*, *exclude*, *many*, ...])

---

## app.serializers.role.RoleName

```
class app.serializers.role.RoleName(*, load_default: Any = <marshmallow.missing>, missing: Any = <marshmallow.missing>, dump_default: Any = <marshmallow.missing>, default: Any = <marshmallow.missing>, data_key: Optional[str] = None, attribute: Optional[str] = None, validate: Optional[Union[Callable[[Any], Any], Iterable[Callable[[Any], Any]]]] = None, required: bool = False, allow_none: Optional[bool] = None, load_only: bool = False, dump_only: bool = False, error_messages: Optional[Dict[str, str]] = None, metadata: Optional[Mapping[str, Any]] = None, **additional_metadata)
```

Bases: `marshmallow.fields.Field`

### Attributes

<code>RoleName.context</code>	The context dictionary for the parent Schema.
<code>RoleName.default</code>	
<code>RoleName.default_error_messages</code>	Default error messages for various kinds of errors.
<code>RoleName.missing</code>	
<code>RoleName.name</code>	
<code>RoleName.parent</code>	

continues on next page

Table 114 – continued from previous page

---

`RoleName.root`

---

`app.serializers.role.RoleName.context`

**property RoleName.context**

The context dictionary for the parent Schema.

`app.serializers.role.RoleName.default`

**property RoleName.default**

`app.serializers.role.RoleName.default_error_messages`

`RoleName.default_error_messages = {'null': 'Field may not be null.', 'required': 'Missing data for required field.', 'validator_failed': 'Invalid value.'}`

Default error messages for various kinds of errors. The keys in this dictionary are passed to `Field.make_error`. The values are error messages passed to `marshmallow.exceptions.ValidationError`.

`app.serializers.role.RoleName.missing`

**property RoleName.missing**

`app.serializers.role.RoleName.name`

`RoleName.name = None`

`app.serializers.role.RoleName.parent`

`RoleName.parent = None`

`app.serializers.role.RoleName.root`

`RoleName.root = None`

## Methods

---

<code>RoleName.__init__(*[, load_default, ...])</code>	
<code>RoleName.deserialize(value[, attr, data])</code>	Deserialize <code>value</code> .
<code>RoleName.fail(key, **kwargs)</code>	Helper method that raises a <code>ValidationError</code> with an error message from <code>self.error_messages</code> .
<code>RoleName.get_value(obj[, attr[, accessor, ...]])</code>	Return the value for a given key from an object.
<code>RoleName.make_error(key, **kwargs)</code>	Helper method to make a <code>ValidationError</code> with an error message from <code>self.error_messages</code> .
<code>RoleName.serialize(attr, obj[, accessor])</code>	Pulls the value for the given key from the object, applies the field's formatting and returns the result.

---

### app.serializers.role.RoleName.\_\_init\_\_

```
RoleName.__init__(*, load_default: Any = <marshmallow.missing>, missing: Any = <marshmallow.missing>, dump_default: Any = <marshmallow.missing>, default: Any = <marshmallow.missing>, data_key: Optional[str] = None, attribute: Optional[str] = None, validate: Optional[Union[Callable[[Any], Any], Iterable[Callable[[Any], Any]]]] = None, required: bool = False, allow_none: Optional[bool] = None, load_only: bool = False, dump_only: bool = False, error_messages: Optional[Dict[str, str]] = None, metadata: Optional[Mapping[str, Any]] = None, **additional_metadata) → None
```

### app.serializers.role.RoleName.deserialize

```
RoleName.deserialize(value: Any, attr: Optional[str] = None, data: Optional[Mapping[str, Any]] = None, **kwargs)
```

Deserialize `value`.

#### Parameters

- `value` – The value to deserialize.
- `attr` – The attribute/key in `data` to deserialize.
- `data` – The raw input data passed to `Schema.load`.
- `kwargs` – Field-specific keyword arguments.

**Raises** `ValidationError` – If an invalid value is passed or if a required value is missing.

**app.serializers.role.RoleName.fail****RoleName.fail(key: str, \*\*kwargs)**

Helper method that raises a *ValidationError* with an error message from `self.error_messages`.

Deprecated since version 3.0.0: Use `make_error <marshmallow.fields.Field.make_error>` instead.

**app.serializers.role.RoleName.get\_value****RoleName.get\_value(obj, attr, accessor=None, default=<marshmallow.missing>)**

Return the value for a given key from an object.

**Parameters**

- **obj (object)** – The object to get the value from.
- **attr (str)** – The attribute/key in `obj` to get the value from.
- **accessor (callable)** – A callable used to retrieve the value of `attr` from the object `obj`. Defaults to `marshmallow.utils.get_value`.

**app.serializers.role.RoleName.make\_error****RoleName.make\_error(key: str, \*\*kwargs) → marshmallow.exceptions.ValidationError**

Helper method to make a *ValidationError* with an error message from `self.error_messages`.

**app.serializers.role.RoleName.serialize****RoleName.serialize(attr: str, obj: Any, accessor: Optional[Callable[[Any, str, Any], Any]] = None, \*\*kwargs)**

Pulls the value for the given key from the object, applies the field's formatting and returns the result.

**Parameters**

- **attr** – The attribute/key to get from the object.
- **obj** – The object to access the attribute/key from.
- **accessor** – Function used to access values from `obj`.
- **kwargs** – Field-specific keyword arguments.

**app.serializers.role.RoleSerializer**

```
class app.serializers.role.RoleSerializer(*, only: Optional[Union[Sequence[str], Set[str]]] = None,
                                         exclude: Union[Sequence[str], Set[str]] = (), many: bool = False,
                                         context: Optional[Dict] = None, load_only: Union[Sequence[str], Set[str]] = (),
                                         dump_only: Union[Sequence[str], Set[str]] = (), partial: Union[bool,
                                         Sequence[str], Set[str]] = False, unknown: Optional[str] = None)
```

Bases: `flask_marshmallow.schema.Schema`

```

## app.serializers.role.RoleSerializer.dump

`RoleSerializer.dump(obj: Any, *, many: Optional[bool] = None)`

Serialize an object to native Python data types according to this Schema's fields.

**Parameters**

- **obj** – The object to serialize.
- **many** – Whether to serialize *obj* as a collection. If *None*, the value for *self.many* is used.

**Returns** Serialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if *obj* is invalid.

Changed in version 3.0.0rc9: Validation no longer occurs upon serialization.

## app.serializers.role.RoleSerializer.dumps

`RoleSerializer.dumps(obj: Any, *args, many: Optional[bool] = None, **kwargs)`

Same as `dump()`, except return a JSON-encoded string.

**Parameters**

- **obj** – The object to serialize.
- **many** – Whether to serialize *obj* as a collection. If *None*, the value for *self.many* is used.

**Returns** A json string

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if *obj* is invalid.

## app.serializers.role.RoleSerializer.from\_dict

`classmethod RoleSerializer.from_dict(fields: Dict[str, Union[marshmallow.fields.Field, type]], *, name: str = 'GeneratedSchema') → type`

Generate a *Schema* class given a dictionary of fields.

```
from marshmallow import Schema, fields

PersonSchema = Schema.from_dict({"name": fields.Str()})
print(PersonSchema().load({"name": "David"})) # => {'name': 'David'}
```

Generated schemas are not added to the class registry and therefore cannot be referred to by name in *Nested* fields.

**Parameters**

- **fields (dict)** – Dictionary mapping field names to field instances.
- **name (str)** – Optional name for the class, which will appear in the `repr` for the class.

New in version 3.0.0.

**app.serializers.role.RoleSerializer.get\_attribute****RoleSerializer.get\_attribute**(*obj*: Any, *attr*: str, *default*: Any)

Defines how to pull values from an object to serialize.

New in version 2.0.0.

Changed in version 3.0.0a1: Changed position of *obj* and *attr*.**app.serializers.role.RoleSerializer.handle\_error****RoleSerializer.handle\_error**(*error*: marshmallow.exceptions.ValidationError, *data*: Any, \*, *many*: bool, \*\**kwargs*)

Custom error handler function for the schema.

**Parameters**

- **error** – The *ValidationError* raised during (de)serialization.
- **data** – The original input data.
- **many** – Value of *many* on dump or load.
- **partial** – Value of *partial* on load.

New in version 2.0.0.

Changed in version 3.0.0rc9: Receives *many* and *partial* (on deserialization) as keyword arguments.**app.serializers.role.RoleSerializer.jsonify****RoleSerializer.jsonify**(*obj*, *many*=<object object>, \**args*, \*\**kwargs*)

Return a JSON response containing the serialized data.

**Parameters**

- **obj** – Object to serialize.
- **many** (bool) – Whether *obj* should be serialized as an instance or as a collection.  
If unset, defaults to the value of the *many* attribute on this Schema.
- **kwargs** – Additional keyword arguments passed to *flask.jsonify*.

Changed in version 0.6.0: Takes the same arguments as *marshmallow.Schema.dump*. Additional keyword arguments are passed to *flask.jsonify*.Changed in version 0.6.3: The *many* argument for this method defaults to the value of the *many* attribute on the Schema. Previously, the *many* argument of this method defaulted to False, regardless of the value of *Schema.many*.**app.serializers.role.RoleSerializer.load****RoleSerializer.load**(*data*: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], \*, *many*: Optional[bool] = None, *partial*: Optional[Union[bool, Sequence[str], Set[str]]] = None, *unknown*: Optional[str] = None)

Deserialize a data structure to an object defined by this Schema's fields.

**Parameters**

- **data** – The data to deserialize.
- **many** – Whether to deserialize *data* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared.  
Propagates down to *Nested* fields as well. If its value is an iterable, only missing

fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.

- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.

**Returns** Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if invalid data are passed.

### app.serializers.role.RoleSerializer.loads

```
RoleSerializer.loads(json_data: str, *, many: Optional[bool] = None, partial:  
                      Optional[Union[bool, Sequence[str], Set[str]]] = None, unknown:  
                      Optional[str] = None, **kwargs)
```

Same as `load()`, except it takes a JSON string as input.

**Parameters**

- **json\_data** – A JSON string of the data to deserialize.
- **many** – Whether to deserialize *obj* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.

**Returns** Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if invalid data are passed.

### app.serializers.role.RoleSerializer.on\_bind\_field

```
RoleSerializer.on_bind_field(field_name: str, field_obj: marshmallow.fields.Field) →  
None
```

Hook to modify a field when it is bound to the *Schema*.

No-op by default.

### app.serializers.role.RoleSerializer.slugify\_name

```
RoleSerializer.slugify_name(item, many, **kwargs)
```

**app.serializers.role.RoleSerializer.validate**

```
RoleSerializer.validate(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *,  
    many: Optional[bool] = None, partial: Optional[Union[bool,  
        Sequence[str], Set[str]]] = None) → Dict[str, List[str]]
```

Validate *data* against the schema, returning a dictionary of validation errors.

**Parameters**

- **data** – The data to validate.
- **many** – Whether to validate *data* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.

**Returns** A dictionary of validation errors.

New in version 1.1.0.

**app.serializers.role.RoleSerializer.validate\_id**

```
RoleSerializer.validate_id(role_id)
```

**app.serializers.role.RoleSerializer.validate\_name**

```
RoleSerializer.validate_name(value, **kwargs)
```

```
class app.serializers.role.RoleName(*, load_default: Any = <marshmallow.missing>, missing: Any =  
    <marshmallow.missing>, dump_default: Any =  
    <marshmallow.missing>, default: Any = <marshmallow.missing>,  
    data_key: Optional[str] = None, attribute: Optional[str] = None,  
    validate: Optional[Union[Callable[[Any], Any],  
        Iterable[Callable[[Any], Any]]]] = None, required: bool = False,  
    allow_none: Optional[bool] = None, load_only: bool = False,  
    dump_only: bool = False, error_messages: Optional[Dict[str, str]] =  
    None, metadata: Optional[Mapping[str, Any]] = None,  
    **additional_metadata)
```

```
_CHECK_ATTRIBUTE = True
```

```
_bind_to_schema(field_name, schema)
```

Update field with values from its parent schema. Called by Schema.\_bind\_field.

**Parameters**

- **field\_name** (*str*) – Field name set in schema.
- **schema** (*Schema* / *Field*) – Parent object.

```
_creation_index = 129
```

```
_deserialize(value, *args, **kwargs)
```

Deserialize value. Concrete Field classes should implement this method.

**Parameters**

- **value** – The value to be deserialized.

- **attr** – The attribute/key in *data* to be deserialized.
- **data** – The raw input data passed to the *Schema.load*.
- **kwargs** – Field-specific keyword arguments.

**Raises** `ValidationError` – In case of formatting or validation failure.

**Returns** The deserialized value.

Changed in version 2.0.0: Added `attr` and `data` parameters.

Changed in version 3.0.0: Added `**kwargs` to signature.

#### `_serialize(value, *args, **kwargs)`

Serializes `value` to a basic Python datatype. Noop by default. Concrete `Field` classes should implement this method.

Example:

```
class TitleCase(Field):
    def _serialize(self, value, attr, obj, **kwargs):
        if not value:
            return ''
        return str(value).title()
```

#### Parameters

- **value** – The value to be serialized.
- **attr (str)** – The attribute or key on the object to be serialized.
- **obj (object)** – The object the value was pulled from.
- **kwargs (dict)** – Field-specific keyword arguments.

**Returns** The serialized value

#### `_validate(value)`

Perform validation on `value`. Raise a `ValidationError` if validation does not succeed.

#### `property _validate_all`

#### `_validate_missing(value)`

Validate missing values. Raise a `ValidationError` if `value` should be considered missing.

#### `property context`

The context dictionary for the parent Schema.

#### `property default`

```
default_error_messages = {'null': 'Field may not be null.', 'required': 'Missing data for required field.', 'validator_failed': 'Invalid value.'}
```

Default error messages for various kinds of errors. The keys in this dictionary are passed to `Field.make_error`. The values are error messages passed to `marshmallow.exceptions.ValidationError`.

**deserialize**(*value*: Any, *attr*: Optional[str] = None, *data*: Optional[Mapping[str, Any]] = None, `**kwargs`)  
Deserialize `value`.

#### Parameters

- **value** – The value to deserialize.
- **attr** – The attribute/key in *data* to deserialize.

- **data** – The raw input data passed to *Schema.load*.
- **kwargs** – Field-specific keyword arguments.

**Raises ValidationError** – If an invalid value is passed or if a required value is missing.

**fail(key: str, \*\*kwargs)**

Helper method that raises a *ValidationError* with an error message from `self.error_messages`.

Deprecated since version 3.0.0: Use `make_error <marshmallow.fields.Field.make_error>` instead.

**get\_value(obj, attr, accessor=None, default=<marshmallow.missing>)**

Return the value for a given key from an object.

#### Parameters

- **obj (object)** – The object to get the value from.
- **attr (str)** – The attribute/key in `obj` to get the value from.
- **accessor (callable)** – A callable used to retrieve the value of `attr` from the object `obj`. Defaults to `marshmallow.utils.get_value`.

**make\_error(key: str, \*\*kwargs) → marshmallow.exceptions.ValidationError**

Helper method to make a *ValidationError* with an error message from `self.error_messages`.

**property missing**

**name = None**

**parent = None**

**root = None**

**serialize(attr: str, obj: Any, accessor: Optional[Callable[[Any, str, Any], Any]] = None, \*\*kwargs)**

Pulls the value for the given key from the object, applies the field's formatting and returns the result.

#### Parameters

- **attr** – The attribute/key to get from the object.
- **obj** – The object to access the attribute/key from.
- **accessor** – Function used to access values from `obj`.
- **kwargs** – Field-specific keyword arguments.

**class app.serializers.role.RoleSerializer(\*, only: Optional[Union[Sequence[str], Set[str]]] = None, exclude: Union[Sequence[str], Set[str]] = (), many: bool = False, context: Optional[Dict] = None, load\_only: Union[Sequence[str], Set[str]] = (), dump\_only: Union[Sequence[str], Set[str]] = (), partial: Union[bool, Sequence[str], Set[str]] = False, unknown: Optional[str] = None)**

**class Meta**

**ordered = True**

**OPTIONS\_CLASS**

alias of `marshmallow.schema.SchemaOpts`

```
TYPE_MAPPING = {<class 'str'>: <class 'marshmallow.fields.String'>, <class  
'bytes': <class 'marshmallow.fields.String'>, <class 'datetime.datetime'>: <class  
'marshmallow.fields.DateTime'>, <class 'float'>: <class  
'marshmallow.fields.Float'>, <class 'bool'>: <class 'marshmallow.fields.Boolean'>,  
<class 'tuple'>: <class 'marshmallow.fields.Raw'>, <class 'list'>: <class  
'marshmallow.fields.Raw'>, <class 'set'>: <class 'marshmallow.fields.Raw'>, <class  
'int': <class 'marshmallow.fields.Integer'>, <class 'uuid.UUID'>: <class  
'marshmallow.fields.UUID'>, <class 'datetime.time'>: <class  
'marshmallow.fields.Time'>, <class 'datetime.date'>: <class  
'marshmallow.fields.Date'>, <class 'datetime.timedelta'>: <class  
'marshmallow.fields.TimeDelta'>, <class 'decimal.Decimal'>: <class  
'marshmallow.fields.Decimal'>}
```

**\_bind\_field**(*field\_name*: str, *field\_obj*: marshmallow.fields.Field) → None

Bind field to the schema, setting any necessary attributes on the field (e.g. parent and name).

Also set field load\_only and dump\_only values if *field\_name* was specified in class Meta.

**static \_call\_and\_store**(*getter\_func*, *data*, \*, *field\_name*, *error\_store*, *index=None*)

Call *getter\_func* with *data* as its argument, and store any *ValidationErrors*.

#### Parameters

- **getter\_func** (*callable*) – Function for getting the serialized/deserialized value from *data*.
- **data** – The data passed to *getter\_func*.
- **field\_name** (str) – Field name.
- **index** (int) – Index of the item being validated, if validating a collection, otherwise *None*.

```
_declared_fields = {'created_at':  
<fields.TimestampField(dump_default=<marshmallow.missing>, attribute=None,

_deserialize(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, error_store:  
    marshmallow.error_store.ErrorStore, many: bool = False, partial=False, unknown='raise',  
    index=None) → Union[marshmallow.schema._T, List[marshmallow.schema._T]]
```

Deserialize data.

#### Parameters

- **data** (*dict*) – The data to deserialize.
- **error\_store** (*ErrorStore*) – Structure to store errors.
- **many** (*bool*) – *True* if data should be serialized as a collection.
- **partial** (*bool / tuple*) – Whether to ignore missing fields and not require any fields de-

clared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.

- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*.
- **index** (*int*) – Index of the item being serialized (for storing errors) if serializing a collection, otherwise *None*.

**Returns** A dictionary of the deserialized data.

```
_do_load(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, many: Optional[bool] = None,
          partial: Optional[Union[bool, Sequence[str], Set[str]]] = None, unknown: Optional[str] = None,
          postprocess: bool = True)
```

Deserialize *data*, returning the deserialized result. This method is private API.

#### Parameters

- **data** – The data to deserialize.
- **many** – Whether to deserialize *data* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to validate required fields. If its value is an iterable, only fields listed in that iterable will be ignored will be allowed missing. If *True*, all fields will be allowed missing. If *None*, the value for *self.partial* is used.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.
- **postprocess** – Whether to run post\_load methods..

**Returns** Deserialized data

```
_has_processors(tag) → bool
_hooks = defaultdict(<class 'list'>, {('post_load', False): ['slugify_name'],
                                         'validates': ['validate_id', 'validate_name']})
_init_fields() → None
    Update self.fields, self.load_fields, and self.dump_fields based on schema options. This method is private API.
_invoke_dump_processors(tag: str, data, *, many: bool, original_data=None)
_invoke_field_validators(*, error_store: marshmallow.error_store.ErrorStore, data, many: bool)
_invoke_load_processors(tag: str, data, *, many: bool, original_data, partial: Union[bool,
                                         Sequence[str], Set[str]])
_invoke_processors(tag: str, *, pass_many: bool, data, many: bool, original_data=None, **kwargs)
_invoke_schema_validators(*, error_store: marshmallow.error_store.ErrorStore, pass_many: bool, data,
                           original_data, many: bool, partial: Union[bool, Sequence[str], Set[str]],
                           field_errors: bool = False)
_normalize_nested_options() → None
    Apply then flatten nested schema options. This method is private API.
_run_validator(func, output, *, original_data, error_store, many, partial, pass_original,
               index=None)
_serialize(obj: Union[marshmallow.schema._T, Iterable[marshmallow.schema._T]], *, many: bool =
           False)
    Serialize obj.
```

**Parameters**

- **obj** – The object(s) to serialize.
- **many** (*bool*) – *True* if *data* should be serialized as a collection.

**Returns** A dictionary of the serialized dataChanged in version 1.0.0: Renamed from `marshal`.**property dict\_class: type****dump**(*obj*: Any, \*, *many*: *Optional[bool]* = *None*)

Serialize an object to native Python data types according to this Schema's fields.

**Parameters**

- **obj** – The object to serialize.
- **many** – Whether to serialize *obj* as a collection. If *None*, the value for *self.many* is used.

**Returns** Serialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a (*data*, *errors*) tuple. A `ValidationError` is raised if *obj* is invalid.

Changed in version 3.0.0rc9: Validation no longer occurs upon serialization.

**dumps**(*obj*: Any, \**args*, *many*: *Optional[bool]* = *None*, \*\**kwargs*)Same as `dump()`, except return a JSON-encoded string.**Parameters**

- **obj** – The object to serialize.
- **many** – Whether to serialize *obj* as a collection. If *None*, the value for *self.many* is used.

**Returns** A json string

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a (*data*, *errors*) tuple. A `ValidationError` is raised if *obj* is invalid.**error\_messages = {}**

Overrides for default schema-level error messages

**fields**

Dictionary mapping field\_names -&gt; Field objects

**classmethod from\_dict**(*fields*: *Dict[str, Union[marshmallow.fields.Field, type]]*, \*, *name*: *str* = '*GeneratedSchema*') → *type*Generate a *Schema* class given a dictionary of fields.

```
from marshmallow import Schema, fields
```

```
PersonSchema = Schema.from_dict({'name': fields.Str()})
print(PersonSchema().load({'name': 'David'})) # => {'name': 'David'}
```

Generated schemas are not added to the class registry and therefore cannot be referred to by name in *Nested* fields.**Parameters**

- **fields** (*dict*) – Dictionary mapping field names to field instances.

- **name** (*str*) – Optional name for the class, which will appear in the `repr` for the class.

New in version 3.0.0.

**get\_attribute**(*obj: Any, attr: str, default: Any*)

Defines how to pull values from an object to serialize.

New in version 2.0.0.

Changed in version 3.0.0a1: Changed position of `obj` and `attr`.

**handle\_error**(*error: marshmallow.exceptions.ValidationError, data: Any, \*, many: bool, \*\*kwargs*)

Custom error handler function for the schema.

**Parameters**

- **error** – The `ValidationError` raised during (de)serialization.
- **data** – The original input data.
- **many** – Value of `many` on dump or load.
- **partial** – Value of `partial` on load.

New in version 2.0.0.

Changed in version 3.0.0rc9: Receives `many` and `partial` (on deserialization) as keyword arguments.

**jsonify**(*obj, many=<object object>, \*args, \*\*kwargs*)

Return a JSON response containing the serialized data.

**Parameters**

- **obj** – Object to serialize.
- **many** (*bool*) – Whether `obj` should be serialized as an instance or as a collection. If unset, defaults to the value of the `many` attribute on this Schema.
- **kwargs** – Additional keyword arguments passed to `flask.jsonify`.

Changed in version 0.6.0: Takes the same arguments as `marshmallow.Schema.dump`. Additional keyword arguments are passed to `flask.jsonify`.

Changed in version 0.6.3: The `many` argument for this method defaults to the value of the `many` attribute on the Schema. Previously, the `many` argument of this method defaulted to False, regardless of the value of `Schema.many`.

**load**(*data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], \*, many: Optional[bool] = None, partial: Optional[Union[bool, Sequence[str], Set[str]]] = None, unknown: Optional[str] = None*)

Deserialize a data structure to an object defined by this Schema's fields.

**Parameters**

- **data** – The data to deserialize.
- **many** – Whether to deserialize `data` as a collection. If `None`, the value for `self.many` is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use `EXCLUDE`, `INCLUDE` or `RAISE`. If `None`, the value for `self.unknown` is used.

**Returns** Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a (data, errors) tuple. A ValidationError is raised if invalid data are passed.

`loads(json_data: str, *, many: Optional[bool] = None, partial: Optional[Union[bool, Sequence[str], Set[str]]] = None, unknown: Optional[str] = None, **kwargs)`

Same as [load\(\)](#), except it takes a JSON string as input.

#### Parameters

- **json\_data** – A JSON string of the data to deserialize.
- **many** – Whether to deserialize *obj* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use EXCLUDE, INCLUDE or RAISE. If *None*, the value for *self.unknown* is used.

#### Returns

Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a (data, errors) tuple. A ValidationError is raised if invalid data are passed.

`on_bind_field(field_name: str, field_obj: marshmallow.fields.Field) → None`

Hook to modify a field when it is bound to the Schema.

No-op by default.

```
opts = <marshmallow.schema.SchemaOpts object>
property set_class: type
slugify_name(item, many, **kwargs)
validate(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, many: Optional[bool] = None,
         partial: Optional[Union[bool, Sequence[str], Set[str]]] = None) → Dict[str, List[str]]
Validate data against the schema, returning a dictionary of validation errors.
```

#### Parameters

- **data** – The data to validate.
- **many** – Whether to validate *data* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.

#### Returns

A dictionary of validation errors.

New in version 1.1.0.

`validate_id(role_id)`

`validate_name(value, **kwargs)`

```

**app.serializers.user.UserExportWordSerializer.dump**

`UserExportWordSerializer.dump(obj: Any, *, many: Optional[bool] = None)`

Serialize an object to native Python data types according to this Schema's fields.

**Parameters**

- **obj** – The object to serialize.
- **many** – Whether to serialize `obj` as a collection. If `None`, the value for `self.many` is used.

**Returns** Serialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if `obj` is invalid.

Changed in version 3.0.0rc9: Validation no longer occurs upon serialization.

**app.serializers.user.UserExportWordSerializer.dumps**

`UserExportWordSerializer.dumps(obj: Any, *args, many: Optional[bool] = None, **kwargs)`  
Same as `dump()`, except return a JSON-encoded string.

**Parameters**

- **obj** – The object to serialize.
- **many** – Whether to serialize *obj* as a collection. If *None*, the value for *self.many* is used.

**Returns** A json string

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if *obj* is invalid.

**app.serializers.user.UserExportWordSerializer.from\_dict**

**classmethod** `UserExportWordSerializer.from_dict(fields: Dict[str, Union[marshmallow.fields.Field, type]], *, name: str = 'GeneratedSchema') → type`

Generate a *Schema* class given a dictionary of fields.

```
from marshmallow import Schema, fields

PersonSchema = Schema.from_dict({"name": fields.Str()})
print(PersonSchema().load({"name": "David"})) # => {'name': 'David'}
```

Generated schemas are not added to the class registry and therefore cannot be referred to by name in *Nested* fields.

**Parameters**

- **fields** (*dict*) – Dictionary mapping field names to field instances.
- **name** (*str*) – Optional name for the class, which will appear in the `repr` for the class.

New in version 3.0.0.

**app.serializers.user.UserExportWordSerializer.get\_attribute**

`UserExportWordSerializer.get_attribute(obj: Any, attr: str, default: Any)`  
Defines how to pull values from an object to serialize.

New in version 2.0.0.

Changed in version 3.0.0a1: Changed position of *obj* and *attr*.

## app.serializers.user.UserExportWordSerializer.handle\_error

```
UserExportWordSerializer.handle_error(error: marshmallow.exceptions.ValidationError,  
                                     data: Any, *, many: bool, **kwargs)
```

Custom error handler function for the schema.

### Parameters

- **error** – The *ValidationError* raised during (de)serialization.
- **data** – The original input data.
- **many** – Value of *many* on dump or load.
- **partial** – Value of *partial* on load.

New in version 2.0.0.

Changed in version 3.0.0rc9: Receives *many* and *partial* (on deserialization) as keyword arguments.

## app.serializers.user.UserExportWordSerializer.jsonify

```
UserExportWordSerializer.jsonify(obj, many=<object object>, *args, **kwargs)
```

Return a JSON response containing the serialized data.

### Parameters

- **obj** – Object to serialize.
- **many** (*bool*) – Whether *obj* should be serialized as an instance or as a collection.  
If unset, defaults to the value of the *many* attribute on this Schema.
- **kwargs** – Additional keyword arguments passed to *flask.jsonify*.

Changed in version 0.6.0: Takes the same arguments as *marshmallow.Schema.dump*. Additional keyword arguments are passed to *flask.jsonify*.

Changed in version 0.6.3: The *many* argument for this method defaults to the value of the *many* attribute on the Schema. Previously, the *many* argument of this method defaulted to False, regardless of the value of *Schema.many*.

## app.serializers.user.UserExportWordSerializer.load

```
UserExportWordSerializer.load(data: Union[Mapping[str, Any], Iterable[Mapping[str,  
                                         Any]]], *, many: Optional[bool] = None, partial:  
                                         Optional[Union[bool, Sequence[str], Set[str]]] = None,  
                                         unknown: Optional[str] = None)
```

Deserialize a data structure to an object defined by this Schema's fields.

### Parameters

- **data** – The data to deserialize.
- **many** – Whether to deserialize *data* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.

### Returns

Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if invalid data are passed.

### `app.serializers.user.UserExportWordSerializer.loads`

```
UserExportWordSerializer.loads(json_data: str, *, many: Optional[bool] = None, partial: Optional[Union[bool, Sequence[str], Set[str]]] = None, unknown: Optional[str] = None, **kwargs)
```

Same as `load()`, except it takes a JSON string as input.

#### Parameters

- **json\_data** – A JSON string of the data to deserialize.
- **many** – Whether to deserialize *obj* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.

#### Returns

Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if invalid data are passed.

### `app.serializers.user.UserExportWordSerializer.on_bind_field`

```
UserExportWordSerializer.on_bind_field(field_name: str, field_obj: marshmallow.fields.Field) → None
```

Hook to modify a field when it is bound to the `Schema`.

No-op by default.

### `app.serializers.user.UserExportWordSerializer.process_input`

```
UserExportWordSerializer.process_input(value, many, **kwargs)
```

### `app.serializers.user.UserExportWordSerializer.validate`

```
UserExportWordSerializer.validate(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, many: Optional[bool] = None, partial: Optional[Union[bool, Sequence[str], Set[str]]] = None) → Dict[str, List[str]]
```

Validate *data* against the schema, returning a dictionary of validation errors.

#### Parameters

- **data** – The data to validate.
- **many** – Whether to validate *data* as a collection. If *None*, the value for *self.many* is used.

- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.

**Returns** A dictionary of validation errors.

New in version 1.1.0.

## app.serializers.user.UserSerializer

```
class app.serializers.user.UserSerializer(*, only: Optional[Union[Sequence[str], Set[str]]] = None,
                                         exclude: Union[Sequence[str], Set[str]] = (), many: bool = False,
                                         context: Optional[Dict] = None, load_only: Union[Sequence[str], Set[str]] = (),
                                         dump_only: Union[Sequence[str], Set[str]] = (), partial: Union[bool,
                                         Sequence[str], Set[str]] = False, unknown: Optional[str] = None)
```

Bases: flask\_marshmallow.schema.Schema

### Attributes

---

UserSerializer.TYPE\_MAPPING

---

UserSerializer.dict\_class

---

UserSerializer.error\_messages                          Overrides for default schema-level error messages

---

UserSerializer.opts

---

UserSerializer.set\_class

---

### app.serializers.user.UserSerializer.TYPE\_MAPPING

```
UserSerializer.TYPE_MAPPING = {<class 'str': <class
'marshmallow.fields.String', <class 'bytes': <class
'marshmallow.fields.String', <class 'datetime.datetime': <class
'marshmallow.fields.DateTime', <class 'float': <class
'marshmallow.fields.Float', <class 'bool': <class
'marshmallow.fields.Boolean', <class 'tuple': <class
'marshmallow.fields.Raw', <class 'list': <class
'marshmallow.fields.Raw', <class 'set': <class 'marshmallow.fields.Raw',

```

```
app.serializers.user.UserSerializer.dict_class

property UserSerializer.dict_class: type

app.serializers.user.UserSerializer.error_messages

UserSerializer.error_messages = {}
Overrides for default schema-level error messages

app.serializers.user.UserSerializer.opts

UserSerializer.opts = <marshmallow.schema.SchemaOpts object>

app.serializers.user.UserSerializer.set_class

property UserSerializer.set_class: type
```

## Methods

---

<code>UserSerializer.__init__(*[only, exclude, ...])</code>	
<code>UserSerializer.dump(obj, *[many])</code>	Serialize an object to native Python data types according to this Schema's fields.
<code>UserSerializer.dumps(obj, *args[, many])</code>	Same as <code>dump()</code> , except return a JSON-encoded string.
<code>UserSerializer.from_dict(fields, *[name])</code>	Generate a <i>Schema</i> class given a dictionary of fields.
<code>UserSerializer.get_attribute(obj, attr, default)</code>	Defines how to pull values from an object to serialize.
<code>UserSerializer.handle_error(error, data, *, ...)</code>	Custom error handler function for the schema.
<code>UserSerializer.jsonify(obj[, many])</code>	Return a JSON response containing the serialized data.
<code>UserSerializer.load(data, *[many, ...])</code>	Deserialize a data structure to an object defined by this Schema's fields.
<code>UserSerializer.loads(json_data, *[many, ...])</code>	Same as <code>load()</code> , except it takes a JSON string as input.
<code>UserSerializer.on_bind_field(field_name, ...)</code>	Hook to modify a field when it is bound to the <i>Schema</i> .
<code>UserSerializer.validate(data, *[many, partial])</code>	Validate <i>data</i> against the schema, returning a dictionary of validation errors.
<code>UserSerializer.validate_email(email)</code>	
<code>UserSerializer.validate_id(user_id)</code>	

---

### app.serializers.user.UserSerializer.\_\_init\_\_

```
UserSerializer.__init__(*, only: Optional[Union[Sequence[str], Set[str]]] = None, exclude: Union[Sequence[str], Set[str]] = (), many: bool = False, context: Optional[Dict] = None, load_only: Union[Sequence[str], Set[str]] = (), dump_only: Union[Sequence[str], Set[str]] = (), partial: Union[bool, Sequence[str], Set[str]] = False, unknown: Optional[str] = None)
```

### app.serializers.user.UserSerializer.dump

```
UserSerializer.dump(obj: Any, *, many: Optional[bool] = None)
```

Serialize an object to native Python data types according to this Schema's fields.

#### Parameters

- **obj** – The object to serialize.
- **many** – Whether to serialize *obj* as a collection. If *None*, the value for *self.many* is used.

#### Returns

Serialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if *obj* is invalid.

Changed in version 3.0.0rc9: Validation no longer occurs upon serialization.

### app.serializers.user.UserSerializer.dumps

```
UserSerializer.dumps(obj: Any, *args, many: Optional[bool] = None, **kwargs)
```

Same as `dump()`, except return a JSON-encoded string.

#### Parameters

- **obj** – The object to serialize.
- **many** – Whether to serialize *obj* as a collection. If *None*, the value for *self.many* is used.

#### Returns

A json string

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if *obj* is invalid.

### app.serializers.user.UserSerializer.from\_dict

```
classmethod UserSerializer.from_dict(fields: Dict[str, Union[marshmallow.fields.Field, type]], *, name: str = 'GeneratedSchema') → type
```

Generate a *Schema* class given a dictionary of fields.

```
from marshmallow import Schema, fields

PersonSchema = Schema.from_dict({"name": fields.Str()})
print(PersonSchema().load({"name": "David"})) # => {'name': 'David'}
```

Generated schemas are not added to the class registry and therefore cannot be referred to by name in *Nested* fields.

**Parameters**

- **fields** (*dict*) – Dictionary mapping field names to field instances.
- **name** (*str*) – Optional name for the class, which will appear in the `repr` for the class.

New in version 3.0.0.

### `app.serializers.user.UserSerializer.get_attribute`

`UserSerializer.get_attribute(obj: Any, attr: str, default: Any)`

Defines how to pull values from an object to serialize.

New in version 2.0.0.

Changed in version 3.0.0a1: Changed position of `obj` and `attr`.

### `app.serializers.user.UserSerializer.handle_error`

`UserSerializer.handle_error(error: marshmallow.exceptions.ValidationError, data: Any, *, many: bool, **kwargs)`

Custom error handler function for the schema.

**Parameters**

- **error** – The `ValidationError` raised during (de)serialization.
- **data** – The original input data.
- **many** – Value of `many` on dump or load.
- **partial** – Value of `partial` on load.

New in version 2.0.0.

Changed in version 3.0.0rc9: Receives `many` and `partial` (on deserialization) as keyword arguments.

### `app.serializers.user.UserSerializer.jsonify`

`UserSerializer.jsonify(obj, many=<object object>, *args, **kwargs)`

Return a JSON response containing the serialized data.

**Parameters**

- **obj** – Object to serialize.
- **many** (*bool*) – Whether `obj` should be serialized as an instance or as a collection.  
If unset, defaults to the value of the `many` attribute on this Schema.
- **kwargs** – Additional keyword arguments passed to `flask.jsonify`.

Changed in version 0.6.0: Takes the same arguments as `marshmallow.Schema.dump`. Additional keyword arguments are passed to `flask.jsonify`.

Changed in version 0.6.3: The `many` argument for this method defaults to the value of the `many` attribute on the Schema. Previously, the `many` argument of this method defaulted to False, regardless of the value of `Schema.many`.

## app.serializers.user.UserSerializer.load

```
UserSerializer.load(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, many:  
    Optional[bool] = None, partial: Optional[Union[bool, Sequence[str],  
        Set[str]]] = None, unknown: Optional[str] = None)
```

Deserialize a data structure to an object defined by this Schema's fields.

### Parameters

- **data** – The data to deserialize.
- **many** – Whether to deserialize *data* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.

### Returns

Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if invalid data are passed.

## app.serializers.user.UserSerializer.loads

```
UserSerializer.loads(json_data: str, *, many: Optional[bool] = None, partial:  
    Optional[Union[bool, Sequence[str], Set[str]]] = None, unknown:  
    Optional[str] = None, **kwargs)
```

Same as `load()`, except it takes a JSON string as input.

### Parameters

- **json\_data** – A JSON string of the data to deserialize.
- **many** – Whether to deserialize *obj* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.

### Returns

Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if invalid data are passed.

**app.serializers.user.UserSerializer.on\_bind\_field**

```
UserSerializer.on_bind_field(field_name: str, field_obj: marshmallow.fields.Field) →  
    None
```

Hook to modify a field when it is bound to the *Schema*.

No-op by default.

**app.serializers.user.UserSerializer.validate**

```
UserSerializer.validate(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *,  
    many: Optional[bool] = None, partial: Optional[Union[bool,  
        Sequence[str], Set[str]]] = None) → Dict[str, List[str]]
```

Validate *data* against the schema, returning a dictionary of validation errors.

**Parameters**

- **data** – The data to validate.
- **many** – Whether to validate *data* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to **Nested** fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.

**Returns** A dictionary of validation errors.

New in version 1.1.0.

**app.serializers.user.UserSerializer.validate\_email**

```
UserSerializer.validate_email(email: str)
```

**app.serializers.user.UserSerializer.validate\_id**

```
UserSerializer.validate_id(user_id: int)
```

**app.serializers.user.VerifyRoleId**

```
class app.serializers.user.VerifyRoleId(*, load_default: Any = <marshmallow.missing>, missing: Any  
    = <marshmallow.missing>, dump_default: Any =  
    <marshmallow.missing>, default: Any =  
    <marshmallow.missing>, data_key: Optional[str] = None,  
    attribute: Optional[str] = None, validate:  
    Optional[Union[Callable[[Any], Any], Iterable[Callable[[Any],  
        Any]]]] = None, required: bool = False, allow_none:  
    Optional[bool] = None, load_only: bool = False, dump_only:  
    bool = False, error_messages: Optional[Dict[str, str]] = None,  
    metadata: Optional[Mapping[str, Any]] = None,  
    **additional_metadata)
```

Bases: `marshmallow.fields.Field`

## Attributes

<code>VerifyRoleId.context</code>	The context dictionary for the parent Schema.
<code>VerifyRoleId.default</code>	
<code>VerifyRoleId.default_error_messages</code>	Default error messages for various kinds of errors.
<code>VerifyRoleId.missing</code>	
<code>VerifyRoleId.name</code>	
<code>VerifyRoleId.parent</code>	
<code>VerifyRoleId.root</code>	

---

`app.serializers.user.VerifyRoleId.context`

**property VerifyRoleId.context**

The context dictionary for the parent Schema.

`app.serializers.user.VerifyRoleId.default`

**property VerifyRoleId.default**

`app.serializers.user.VerifyRoleId.default_error_messages`

`VerifyRoleId.default_error_messages = {'null': 'Field may not be null.', 'required': 'Missing data for required field.', 'validator_failed': 'Invalid value.'}`

Default error messages for various kinds of errors. The keys in this dictionary are passed to `Field.make_error`. The values are error messages passed to `marshmallow.exceptions.ValidationError`.

`app.serializers.user.VerifyRoleId.missing`

**property VerifyRoleId.missing**

`app.serializers.user.VerifyRoleId.name`

`VerifyRoleId.name = None`

**app.serializers.user.VerifyRoleId.parent**

```
VerifyRoleId.parent = None
```

**app.serializers.user.VerifyRoleId.root**

```
VerifyRoleId.root = None
```

**Methods**

<code>VerifyRoleId.__init__(*[, load_default, ...])</code>	
<code>VerifyRoleId.deserialize(value[, attr, data])</code>	Deserialize value.
<code>VerifyRoleId.fail(key, **kwargs)</code>	Helper method that raises a <i>ValidationError</i> with an error message from <code>self.error_messages</code> .
<code>VerifyRoleId.get_value(obj, attr[, ...])</code>	Return the value for a given key from an object.
<code>VerifyRoleId.make_error(key, **kwargs)</code>	Helper method to make a <i>ValidationError</i> with an error message from <code>self.error_messages</code> .
<code>VerifyRoleId.serialize(attr, obj[, accessor])</code>	Pulls the value for the given key from the object, applies the field's formatting and returns the result.

**app.serializers.user.VerifyRoleId.\_\_init\_\_**

```
VerifyRoleId.__init__(*, load_default: Any = <marshmallow.missing>, missing: Any = <marshmallow.missing>, dump_default: Any = <marshmallow.missing>, default: Any = <marshmallow.missing>, data_key: Optional[str] = None, attribute: Optional[str] = None, validate: Optional[Union[Callable[[Any], Any], Iterable[Callable[[Any], Any]]]] = None, required: bool = False, allow_none: Optional[bool] = None, load_only: bool = False, dump_only: bool = False, error_messages: Optional[Dict[str, str]] = None, metadata: Optional[Mapping[str, Any]] = None, **additional_metadata) → None
```

**app.serializers.user.VerifyRoleId.deserialize**

```
VerifyRoleId.deserialize(value: Any, attr: Optional[str] = None, data: Optional[Mapping[str, Any]] = None, **kwargs)
```

Deserialize value.

**Parameters**

- **value** – The value to deserialize.
- **attr** – The attribute/key in `data` to deserialize.
- **data** – The raw input data passed to `Schema.load`.
- **kwargs** – Field-specific keyword arguments.

**Raises ValidationError** – If an invalid value is passed or if a required value is missing.

### app.serializers.user.VerifyRoleId.fail

`VerifyRoleId.fail(key: str, **kwargs)`

Helper method that raises a `ValidationError` with an error message from `self.error_messages`.

Deprecated since version 3.0.0: Use `make_error <marshmallow.fields.Field.make_error>` instead.

### app.serializers.user.VerifyRoleId.get\_value

`VerifyRoleId.get_value(obj, attr, accessor=None, default=<marshmallow.missing>)`

Return the value for a given key from an object.

#### Parameters

- **obj (object)** – The object to get the value from.
- **attr (str)** – The attribute/key in `obj` to get the value from.
- **accessor (callable)** – A callable used to retrieve the value of `attr` from the object `obj`. Defaults to `marshmallow.utils.get_value`.

### app.serializers.user.VerifyRoleId.make\_error

`VerifyRoleId.make_error(key: str, **kwargs) → marshmallow.exceptions.ValidationError`

Helper method to make a `ValidationError` with an error message from `self.error_messages`.

### app.serializers.user.VerifyRoleId.serialize

`VerifyRoleId.serialize(attr: str, obj: Any, accessor: Optional[Callable[[Any, str, Any], Any]] = None, **kwargs)`

Pulls the value for the given key from the object, applies the field's formatting and returns the result.

#### Parameters

- **attr** – The attribute/key to get from the object.
- **obj** – The object to access the attribute/key from.
- **accessor** – Function used to access values from `obj`.
- **kwargs** – Field-specific keyword arguments.

`class app.serializers.user.UserExportWordSerializer(*, only: Optional[Union[Sequence[str], Set[str]]] = None, exclude: Union[Sequence[str], Set[str]] = (), many: bool = False, context: Optional[Dict] = None, load_only: Union[Sequence[str], Set[str]] = (), dump_only: Union[Sequence[str], Set[str]] = (), partial: Union[bool, Sequence[str], Set[str]] = False, unknown: Optional[str] = None)`

### class Meta

Options object for a Schema.

Example usage:

```
class Meta:  
    fields = ("id", "email", "date_created")  
    exclude = ("password", "secret_attribute")
```

Available options:

- **fields**: Tuple or list of fields to include in the serialized result.
- **additional**: Tuple or list of fields to include in addition to the explicitly declared fields. additional and fields are mutually-exclusive options.
- **include**: Dictionary of additional fields to include in the schema. It is usually better to define fields as class variables, but you may need to use this option, e.g., if your fields are Python keywords. May be an *OrderedDict*.
- **exclude**: Tuple or list of fields to exclude in the serialized result. Nested fields can be represented with dot delimiters.
- **dateformat**: Default format for *Date* <fields.Date> fields.
- **datetimeformat**: Default format for *DateTime* <fields.DateTime> fields.
- **timeformat**: Default format for *Time* <fields.Time> fields.
- **render\_module**: Module to use for *loads* <Schema.loads> and *dumps* <Schema.dumps>. Defaults to *json* from the standard library.
- **ordered**: If *True*, order serialization output according to the order in which fields were declared. Output of *Schema.dump* will be a *collections.OrderedDict*.
- **index\_errors**: If *True*, errors dictionaries will include the index of invalid items in a collection.
- **load\_only**: Tuple or list of fields to exclude from serialized results.
- **dump\_only**: Tuple or list of fields to exclude from deserialization
- **unknown**: Whether to exclude, include, or raise an error for unknown fields in the data. Use EXCLUDE, INCLUDE or RAISE.
- **register**: Whether to register the Schema with marshmallow's internal class registry. Must be *True* if you intend to refer to this Schema by class name in Nested fields. Only set this to *False* when memory usage is critical. Defaults to *True*.

#### OPTIONS\_CLASS

alias of `marshmallow.schema.SchemaOpts`

```
TYPE_MAPPING = {<class 'str'>: <class 'marshmallow.fields.String'>, <class  
'bytes': <class 'marshmallow.fields.String'>, <class 'datetime.datetime': <class  
'marshmallow.fields.DateTime'>, <class 'float': <class  
'marshmallow.fields.Float'>, <class 'bool': <class 'marshmallow.fields.Boolean'>,  
<class 'tuple': <class 'marshmallow.fields.Raw'>, <class 'list': <class  
'marshmallow.fields.Raw'>, <class 'set': <class 'marshmallow.fields.Raw'>, <class  
'int': <class 'marshmallow.fields.Integer'>, <class 'uuid.UUID': <class  
'marshmallow.fields.UUID'>, <class 'datetime.time': <class  
'marshmallow.fields.Time'>, <class 'datetime.date': <class  
'marshmallow.fields.Date'>, <class 'datetime.timedelta': <class  
'marshmallow.fields.TimeDelta'>, <class 'decimal.Decimal': <class  
'marshmallow.fields.Decimal'>}
```

**\_bind\_field**(*field\_name*: str, *field\_obj*: marshmallow.fields.Field) → None

Bind field to the schema, setting any necessary attributes on the field (e.g. parent and name).

Also set field load\_only and dump\_only values if *field\_name* was specified in class Meta.

**static \_call\_and\_store**(*getter\_func*, *data*, \*, *field\_name*, *error\_store*, *index*=None)

Call *getter\_func* with *data* as its argument, and store any *ValidationErrors*.

#### Parameters

- **getter\_func** (*callable*) – Function for getting the serialized/deserialized value from *data*.
- **data** – The data passed to *getter\_func*.
- **field\_name** (str) – Field name.
- **index** (int) – Index of the item being validated, if validating a collection, otherwise *None*.

```
_declared_fields = {'to_pdf': <fields.Integer(dump_default=<marshmallow.missing>, attribute=None, validate=<OneOf(choices=[1, 0], labels=[], error='Must be one of: {choices}.'), required=False, load_only=False, dump_only=False, load_default=<marshmallow.missing>, allow_none=False, error_messages={'required': 'Missing data for required field.', 'null': 'Field may not be null.', 'validator_failed': 'Invalid value.', 'invalid': 'Not a valid integer.', 'too_large': 'Number too large.'})>}
```

```
_default_error_messages = {'type': 'Invalid input type.', 'unknown': 'Unknown field.'}
```

```
_deserialize(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, error_store: marshmallow.error_store.ErrorStore, many: bool = False, partial=False, unknown='raise', index=None) → Union[marshmallow.schema._T, List[marshmallow.schema._T]]
```

Deserialize data.

#### Parameters

- **data** (*dict*) – The data to deserialize.
- **error\_store** (*ErrorStore*) – Structure to store errors.
- **many** (bool) – *True* if data should be serialized as a collection.
- **partial** (bool / tuple) – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use EXCLUDE, INCLUDE or RAISE.
- **index** (int) – Index of the item being serialized (for storing errors) if serializing a collection, otherwise *None*.

**Returns** A dictionary of the serialized data.

```
_do_load(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, many: Optional[bool] = None, partial: Optional[Union[bool, Sequence[str], Set[str]]] = None, unknown: Optional[str] = None, postprocess: bool = True)
```

Deserialize *data*, returning the serialized result. This method is private API.

#### Parameters

- **data** – The data to deserialize.
- **many** – Whether to deserialize *data* as a collection. If *None*, the value for *self.many* is used.

- **partial** – Whether to validate required fields. If its value is an iterable, only fields listed in that iterable will be ignored will be allowed missing. If *True*, all fields will be allowed missing. If *None*, the value for *self.partial* is used.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.
- **postprocess** – Whether to run post\_load methods..

**Returns** Deserialized data

```
_has_processors(tag) → bool
_hooks = {('pre_load', False): ['process_input']}
_init_fields() → None
    Update self.fields, self.load_fields, and self.dump_fields based on schema options. This method is private API.
_invoke_dump_processors(tag: str, data, *, many: bool, original_data=None)
_invoke_field_validators(*, error_store: marshmallow.error_store.ErrorStore, data, many: bool)
_invoke_load_processors(tag: str, data, *, many: bool, original_data, partial: Union[bool,
    Sequence[str], Set[str]])
_invoke_processors(tag: str, *, pass_many: bool, data, many: bool, original_data=None, **kwargs)
_invoke_schema_validators(*, error_store: marshmallow.error_store.ErrorStore, pass_many: bool, data,
    original_data, many: bool, partial: Union[bool, Sequence[str], Set[str]], field_errors: bool = False)
_normalize_nested_options() → None
    Apply then flatten nested schema options. This method is private API.
_run_validator(serializer_func, output, *, original_data, error_store, many, partial, pass_original,
    index=None)
_serialize(obj: Union[marshmallow.schema._T, Iterable[marshmallow.schema._T]], *, many: bool =
    False)
    Serialize obj.
```

#### Parameters

- **obj** – The object(s) to serialize.
- **many** (*bool*) – *True* if data should be serialized as a collection.

**Returns** A dictionary of the serialized data

Changed in version 1.0.0: Renamed from `marshal`.

**property dict\_class: type**

**dump**(*obj*: Any, \*, many: *Optional[bool]* = *None*)

Serialize an object to native Python data types according to this Schema's fields.

#### Parameters

- **obj** – The object to serialize.
- **many** – Whether to serialize *obj* as a collection. If *None*, the value for *self.many* is used.

**Returns** Serialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if `obj` is invalid.

Changed in version 3.0.0rc9: Validation no longer occurs upon serialization.

**dumps**(*obj*: Any, \**args*, *many*: Optional[bool] = None, \*\**kwargs*)

Same as `dump()`, except return a JSON-encoded string.

#### Parameters

- **obj** – The object to serialize.
- **many** – Whether to serialize *obj* as a collection. If *None*, the value for `self.many` is used.

#### Returns

A json string

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if `obj` is invalid.

**error\_messages** = {}

Overrides for default schema-level error messages

#### fields

Dictionary mapping field\_names -> Field objects

**classmethod from\_dict**(*fields*: Dict[str, Union[marshmallow.fields.Field, type]], \*, *name*: str = 'GeneratedSchema') → type

Generate a `Schema` class given a dictionary of fields.

```
from marshmallow import Schema, fields

PersonSchema = Schema.from_dict({'name': fields.Str()})
print(PersonSchema().load({'name': 'David'})) # => {'name': 'David'}
```

Generated schemas are not added to the class registry and therefore cannot be referred to by name in `Nested` fields.

#### Parameters

- **fields** (*dict*) – Dictionary mapping field names to field instances.
- **name** (*str*) – Optional name for the class, which will appear in the `repr` for the class.

New in version 3.0.0.

**get\_attribute**(*obj*: Any, *attr*: str, *default*: Any)

Defines how to pull values from an object to serialize.

New in version 2.0.0.

Changed in version 3.0.0a1: Changed position of `obj` and `attr`.

**handle\_error**(*error*: marshmallow.exceptions.ValidationError, *data*: Any, \*, *many*: bool, \*\**kwargs*)

Custom error handler function for the schema.

#### Parameters

- **error** – The `ValidationError` raised during (de)serialization.
- **data** – The original input data.
- **many** – Value of `many` on `dump` or `load`.

- **partial** – Value of `partial` on load.

New in version 2.0.0.

Changed in version 3.0.0rc9: Receives `many` and `partial` (on deserialization) as keyword arguments.

**jsonify**(*obj*, *many*=*<object object>*, \**args*, \*\**kwargs*)

Return a JSON response containing the serialized data.

**Parameters**

- **obj** – Object to serialize.
- **many** (*bool*) – Whether *obj* should be serialized as an instance or as a collection. If unset, defaults to the value of the `many` attribute on this Schema.
- **kwargs** – Additional keyword arguments passed to `flask.jsonify`.

Changed in version 0.6.0: Takes the same arguments as `marshmallow.Schema.dump`. Additional keyword arguments are passed to `flask.jsonify`.

Changed in version 0.6.3: The `many` argument for this method defaults to the value of the `many` attribute on the Schema. Previously, the `many` argument of this method defaulted to False, regardless of the value of `Schema.many`.

**load**(*data*: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], \*, *many*: Optional[bool] = None, *partial*: Optional[Union[bool, Sequence[str], Set[str]]] = None, *unknown*: Optional[str] = None)

Deserialize a data structure to an object defined by this Schema's fields.

**Parameters**

- **data** – The data to deserialize.
- **many** – Whether to deserialize *data* as a collection. If *None*, the value for `self.many` is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use `EXCLUDE`, `INCLUDE` or `RAISE`. If *None*, the value for `self.unknown` is used.

**Returns** Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if invalid data are passed.

**loads**(*json\_data*: str, \*, *many*: Optional[bool] = None, *partial*: Optional[Union[bool, Sequence[str], Set[str]]] = None, *unknown*: Optional[str] = None, \*\**kwargs*)

Same as `load()`, except it takes a JSON string as input.

**Parameters**

- **json\_data** – A JSON string of the data to deserialize.
- **many** – Whether to deserialize *obj* as a collection. If *None*, the value for `self.many` is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use `EXCLUDE`, `INCLUDE` or `RAISE`. If *None*, the value for `self.unknown` is used.

**Returns** Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if invalid data are passed.

**on\_bind\_field**(*field\_name*: str, *field\_obj*: marshmallow.fields.Field) → None

Hook to modify a field when it is bound to the *Schema*.

No-op by default.

**opts** = <marshmallow.schema.SchemaOpts object>

**process\_input**(*value*, *many*, \*\**kwargs*)

**property set\_class:** type

**validate**(*data*: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], \*, *many*: Optional[bool] = None, *partial*: Optional[Union[bool, Sequence[str], Set[str]]] = None) → Dict[str, List[str]]

Validate *data* against the schema, returning a dictionary of validation errors.

#### Parameters

- **data** – The data to validate.
- **many** – Whether to validate *data* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.

**Returns** A dictionary of validation errors.

New in version 1.1.0.

**class** app.serializers.user.UserSerializer(\*, *only*: Optional[Union[Sequence[str], Set[str]]] = None, *exclude*: Union[Sequence[str], Set[str]] = (), *many*: bool = False, *context*: Optional[Dict] = None, *load\_only*: Union[Sequence[str], Set[str]] = (), *dump\_only*: Union[Sequence[str], Set[str]] = (), *partial*: Union[bool, Sequence[str], Set[str]] = False, *unknown*: Optional[str] = None)

**class Meta**

**ordered** = True

**OPTIONS\_CLASS**

alias of marshmallow.schema.SchemaOpts

```
TYPE_MAPPING = {<class 'str'>: <class 'marshmallow.fields.String'>, <class  
'bytes': <class 'marshmallow.fields.String'>, <class 'datetime.datetime'>: <class  
'marshmallow.fields.DateTime'>, <class 'float'>: <class  
'marshmallow.fields.Float'>, <class 'bool'>: <class 'marshmallow.fields.Boolean'>,  
<class 'tuple'>: <class 'marshmallow.fields.Raw'>, <class 'list'>: <class  
'marshmallow.fields.Raw'>, <class 'set'>: <class 'marshmallow.fields.Raw'>, <class  
'int': <class 'marshmallow.fields.Integer'>, <class 'uuid.UUID'>: <class  
'marshmallow.fields.UUID'>, <class 'datetime.time'>: <class  
'marshmallow.fields.Time'>, <class 'datetime.date'>: <class  
'marshmallow.fields.Date'>, <class 'datetime.timedelta'>: <class  
'marshmallow.fields.TimeDelta'>, <class 'decimal.Decimal'>: <class  
'marshmallow.fields.Decimal'>}
```

**\_bind\_field**(*field\_name*: str, *field\_obj*: marshmallow.fields.Field) → None

Bind field to the schema, setting any necessary attributes on the field (e.g. parent and name).

Also set field load\_only and dump\_only values if *field\_name* was specified in class Meta.

**static \_call\_and\_store**(*getter\_func*, *data*, \*, *field\_name*, *error\_store*, *index=None*)

Call *getter\_func* with *data* as its argument, and store any *ValidationErrors*.

#### Parameters

- **getter\_func** (*callable*) – Function for getting the serialized/deserialized value from *data*.
- **data** – The data passed to *getter\_func*.
- **field\_name** (str) – Field name.
- **index** (int) – Index of the item being validated, if validating a collection, otherwise *None*.

```

_declared_fields = {'active': <fields.Boolean(dump_default=<marshmallow.missing>, attribute=None, validate=None, required=False, load_only=False, dump_only=False, load_default=<marshmallow.missing>, allow_none=False, error_messages={'required': 'Missing data for required field.'}, 'null': 'Field may not be null.'}, 'validator_failed': 'Invalid value.', 'invalid': 'Not a valid boolean.'}>, 'birth_date': <fields.Date(dump_default=<marshmallow.missing>, attribute=None, validate=None, required=False, load_only=False, dump_only=False, load_default=<marshmallow.missing>, allow_none=False, error_messages={'required': 'Missing data for required field.'}, 'null': 'Field may not be null.'}, 'validator_failed': 'Invalid value.', 'invalid': 'Not a valid date.'}, 'invalid_awareness': 'Not a valid {awareness} {obj_type}.', 'format': '"{input}" cannot be formatted as a date.'}>, 'created_at': <fields.TimestampField(dump_default=<marshmallow.missing>, attribute=None, validate=None, required=False, load_only=False, dump_only=True, load_default=<marshmallow.missing>, allow_none=False, error_messages={'required': 'Missing data for required field.'}, 'null': 'Field may not be null.'}, 'validator_failed': 'Invalid value.'}>, 'created_by': <fields.Nested(dump_default=<marshmallow.missing>, attribute=None, validate=None, required=False, load_only=False, dump_only=False, load_default=<marshmallow.missing>, allow_none=False, error_messages={'required': 'Missing data for required field.'}, 'null': 'Field may not be null.'}, 'validator_failed': 'Invalid value.'}>, 'deleted_at': <fields.TimestampField(dump_default=<marshmallow.missing>, attribute=None, validate=None, required=False, load_only=False, dump_only=True, load_default=<marshmallow.missing>, allow_none=False, error_messages={'required': 'Missing data for required field.'}, 'null': 'Field may not be null.'}, 'validator_failed': 'Invalid value.'}>, 'email': <fields.Email(dump_default=<marshmallow.missing>, attribute=None, validate=None, required=True, load_only=False, dump_only=False, load_default=<marshmallow.missing>, allow_none=False, error_messages={'required': 'Missing data for required field.'}, 'null': 'Field may not be null.'}, 'validator_failed': 'Invalid value.', 'invalid': 'Not a valid email address.'}, 'invalid_utf8': 'Not a valid utf-8 string.'}>, 'genre': <fields.String(dump_default=<marshmallow.missing>, attribute=None, validate=<OneOf(choices=['m', 'f'], labels=[], error='Must be one of: {choices}'>), required=False, load_only=False, dump_only=False, load_default=<marshmallow.missing>, allow_none=False, error_messages={'required': 'Missing data for required field.'}, 'null': 'Field may not be null.'}, 'validator_failed': 'Invalid value.', 'invalid': 'Not a valid string.'}, 'invalid_utf8': 'Not a valid utf-8 string.'}>, 'id': <fields.Integer(dump_default=<marshmallow.missing>, attribute=None, validate=None, required=False, load_only=False, dump_only=False, load_default=<marshmallow.missing>, allow_none=False, error_messages={'required': 'Missing data for required field.'}, 'null': 'Field may not be null.'}, 'validator_failed': 'Invalid value.', 'invalid': 'Not a valid integer.'}, 'too_large': 'Number too large.'}>, 'last_name': <fields.String(dump_default=<marshmallow.missing>, attribute=None, validate=None, required=False, load_only=False, dump_only=False, load_default=<marshmallow.missing>, allow_none=False, error_messages={'required': 'Missing data for required field.'}, 'null': 'Field may not be null.'}, 'validator_failed': 'Invalid value.', 'invalid': 'Not a valid string.'}, 'invalid_utf8': 'Not a valid utf-8 string.'}>, 'name': <fields.String(dump_default=<marshmallow.missing>, attribute=None, validate=None, required=False, load_only=False, dump_only=False, load_default=<marshmallow.missing>, allow_none=False, error_messages={'required': 'Missing data for required field.'}, 'null': 'Field may not be null.'}, 'validator_failed': 'Invalid value.', 'invalid': 'Not a valid string.'}, 'invalid_utf8': 'Not a valid utf-8 string.'}>, 'password': <fields.String(dump_default=<marshmallow.missing>, attribute=None, validate=<Length(min=8, max=50, equal=None, error=None)>, required=False, load_only=True, dump_only=False, load_default=<marshmallow.missing>, allow_none=False, error_messages={'required': 'Missing data for required field.'}, 'null': 'Field may not be null.'}, 'validator_failed': 'Invalid value.', 'invalid': 'Not a valid string.'}, 'invalid_utf8': 'Not a valid utf-8 string.'}>

```

```
_default_error_messages = {'type': 'Invalid input type.', 'unknown': 'Unknown field.'}

_deserialize(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, error_store:
    marshmallow.error_store.ErrorStore, many: bool = False, partial=False, unknown='raise',
    index=None) → Union[marshmallow.schema._T, List[marshmallow.schema._T]]
```

Deserialize data.

#### Parameters

- **data** (*dict*) – The data to deserialize.
- **error\_store** (*ErrorStore*) – Structure to store errors.
- **many** (*bool*) – *True* if data should be serialized as a collection.
- **partial** (*bool / tuple*) – Whether to ignore missing fields and not require any fields declared. Propagates down to Nested fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*.
- **index** (*int*) – Index of the item being serialized (for storing errors) if serializing a collection, otherwise *None*.

**Returns** A dictionary of the serialized data.

```
_do_load(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, many: Optional[bool] = None,
    partial: Optional[Union[bool, Sequence[str], Set[str]]] = None, unknown: Optional[str] = None,
    postprocess: bool = True)
```

Deserialize *data*, returning the serialized result. This method is private API.

#### Parameters

- **data** – The data to deserialize.
- **many** – Whether to deserialize *data* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to validate required fields. If its value is an iterable, only fields listed in that iterable will be allowed missing. If *True*, all fields will be allowed missing. If *None*, the value for *self.partial* is used.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.
- **postprocess** – Whether to run post\_load methods..

**Returns** Deserialized data

```
_has_processors(tag) → bool

_hooks = {'validates': ['validate_email', 'validate_id']}

_init_fields() → None
    Update self.fields, self.load_fields, and self.dump_fields based on schema options. This method is private
    API.

_invoke_dump_processors(tag: str, data, *, many: bool, original_data=None)
_invoke_field_validators(*, error_store: marshmallow.error_store.ErrorStore, data, many: bool)
_invoke_load_processors(tag: str, data, *, many: bool, original_data, partial: Union[bool,
    Sequence[str], Set[str]])
```

```
_invoke_processors(tag: str, *, pass_many: bool, data, many: bool, original_data=None, **kwargs)
```

```
_invoke_schema_validators(*, error_store: marshmallow.error_store.ErrorStore, pass_many: bool, data,
                           original_data, many: bool, partial: Union[bool, Sequence[str], Set[str]],
                           field_errors: bool = False)
```

```
_normalize_nested_options() → None
```

Apply then flatten nested schema options. This method is private API.

```
_run_validator(serializer_func, output, *, original_data, error_store, many, partial, pass_original,
                index=None)
```

```
_serialize(obj: Union[marshmallow.schema._T, Iterable[marshmallow.schema._T]]], *, many: bool =
                           False)
```

Serialize obj.

#### Parameters

- **obj** – The object(s) to serialize.
- **many** (*bool*) – *True* if **data** should be serialized as a collection.

#### Returns

A dictionary of the serialized data

Changed in version 1.0.0: Renamed from `marshal`.

```
property dict_class: type
```

```
dump(obj: Any, *, many: Optional[bool] = None)
```

Serialize an object to native Python data types according to this Schema's fields.

#### Parameters

- **obj** – The object to serialize.
- **many** – Whether to serialize *obj* as a collection. If *None*, the value for *self.many* is used.

#### Returns

Serialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if *obj* is invalid.

Changed in version 3.0.0rc9: Validation no longer occurs upon serialization.

```
dumps(obj: Any, *args, many: Optional[bool] = None, **kwargs)
```

Same as [dump](#)(*obj*), except return a JSON-encoded string.

#### Parameters

- **obj** – The object to serialize.
- **many** – Whether to serialize *obj* as a collection. If *None*, the value for *self.many* is used.

#### Returns

A json string

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the serialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if *obj* is invalid.

```
error_messages = {}
```

Overrides for default schema-level error messages

#### fields

Dictionary mapping `field_names` -> `Field` objects

```
classmethod from_dict(fields: Dict[str, Union[marshmallow.fields.Field, type]], *, name: str =  
    'GeneratedSchema') → type
```

Generate a *Schema* class given a dictionary of fields.

```
from marshmallow import Schema, fields  
  
PersonSchema = Schema.from_dict({"name": fields.Str()})  
print(PersonSchema().load({"name": "David"})) # => {'name': 'David'}
```

Generated schemas are not added to the class registry and therefore cannot be referred to by name in *Nested* fields.

#### Parameters

- **fields** (*dict*) – Dictionary mapping field names to field instances.
- **name** (*str*) – Optional name for the class, which will appear in the `repr` for the class.

New in version 3.0.0.

```
get_attribute(obj: Any, attr: str, default: Any)
```

Defines how to pull values from an object to serialize.

New in version 2.0.0.

Changed in version 3.0.0a1: Changed position of `obj` and `attr`.

```
handle_error(error: marshmallow.exceptions.ValidationError, data: Any, *, many: bool, **kwargs)
```

Custom error handler function for the schema.

#### Parameters

- **error** – The `ValidationError` raised during (de)serialization.
- **data** – The original input data.
- **many** – Value of `many` on dump or load.
- **partial** – Value of `partial` on load.

New in version 2.0.0.

Changed in version 3.0.0rc9: Receives `many` and `partial` (on deserialization) as keyword arguments.

```
jsonify(obj, many=<object object>, *args, **kwargs)
```

Return a JSON response containing the serialized data.

#### Parameters

- **obj** – Object to serialize.
- **many** (*bool*) – Whether `obj` should be serialized as an instance or as a collection. If unset, defaults to the value of the `many` attribute on this *Schema*.
- **kwargs** – Additional keyword arguments passed to `flask.jsonify`.

Changed in version 0.6.0: Takes the same arguments as `marshmallow.Schema.dump`. Additional keyword arguments are passed to `flask.jsonify`.

Changed in version 0.6.3: The `many` argument for this method defaults to the value of the `many` attribute on the *Schema*. Previously, the `many` argument of this method defaulted to `False`, regardless of the value of `Schema.many`.

```
load(data: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], *, many: Optional[bool] = None,  
      partial: Optional[Union[bool, Sequence[str], Set[str]]] = None, unknown: Optional[str] = None)
```

Deserialize a data structure to an object defined by this *Schema*'s fields.

## Parameters

- **data** – The data to deserialize.
- **many** – Whether to deserialize *data* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to **Nested** fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.

## Returns Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if invalid data are passed.

**loads**(*json\_data*: str, \*, *many*: Optional[bool] = *None*, *partial*: Optional[Union[bool, Sequence[str], Set[str]]] = *None*, *unknown*: Optional[str] = *None*, \*\**kwargs*)  
Same as [load\(\)](#), except it takes a JSON string as input.

## Parameters

- **json\_data** – A JSON string of the data to deserialize.
- **many** – Whether to deserialize *obj* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to **Nested** fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.
- **unknown** – Whether to exclude, include, or raise an error for unknown fields in the data. Use *EXCLUDE*, *INCLUDE* or *RAISE*. If *None*, the value for *self.unknown* is used.

## Returns Deserialized data

New in version 1.0.0.

Changed in version 3.0.0b7: This method returns the deserialized data rather than a `(data, errors)` tuple. A `ValidationError` is raised if invalid data are passed.

**on\_bind\_field**(*field\_name*: str, *field\_obj*: marshmallow.fields.Field) → *None*  
Hook to modify a field when it is bound to the *Schema*.  
No-op by default.  
**opts** = <marshmallow.schema.SchemaOpts object>  
**property** *set\_class*: type  
**validate**(*data*: Union[Mapping[str, Any], Iterable[Mapping[str, Any]]], \*, *many*: Optional[bool] = *None*, *partial*: Optional[Union[bool, Sequence[str], Set[str]]] = *None*) → Dict[str, List[str]]  
Validate *data* against the schema, returning a dictionary of validation errors.

## Parameters

- **data** – The data to validate.
- **many** – Whether to validate *data* as a collection. If *None*, the value for *self.many* is used.
- **partial** – Whether to ignore missing fields and not require any fields declared. Propagates down to **Nested** fields as well. If its value is an iterable, only missing fields listed in that iterable will be ignored. Use dot delimiters to specify nested fields.

**Returns** A dictionary of validation errors.

New in version 1.1.0.

`validate_email(email: str)`

`validate_id(user_id: int)`

```
class app.serializers.user.VerifyRoleId(*, load_default: Any = <marshmallow.missing>, missing: Any = <marshmallow.missing>, dump_default: Any = <marshmallow.missing>, default: Any = <marshmallow.missing>, data_key: Optional[str] = None, attribute: Optional[str] = None, validate: Optional[Union[Callable[[Any], Any], Iterable[Callable[[Any], Any]]]] = None, required: bool = False, allow_none: Optional[bool] = None, load_only: bool = False, dump_only: bool = False, error_messages: Optional[Dict[str, str]] = None, metadata: Optional[Mapping[str, Any]] = None, **additional_metadata)
```

`_CHECK_ATTRIBUTE = True`

`_bind_to_schema(field_name, schema)`

Update field with values from its parent schema. Called by `Schema._bind_field`.

#### Parameters

- `field_name (str)` – Field name set in schema.
- `schema (Schema / Field)` – Parent object.

`_creation_index = 129`

`_deserialize(value, *args, **kwargs)`

Deserialize value. Concrete Field classes should implement this method.

#### Parameters

- `value` – The value to be deserialized.
- `attr` – The attribute/key in `data` to be deserialized.
- `data` – The raw input data passed to the `Schema.load`.
- `kwargs` – Field-specific keyword arguments.

**Raises** `ValidationError` – In case of formatting or validation failure.

**Returns** The deserialized value.

Changed in version 2.0.0: Added `attr` and `data` parameters.

Changed in version 3.0.0: Added `**kwargs` to signature.

`_serialize(value: Any, attr: str, obj: Any, **kwargs)`

Serializes value to a basic Python datatype. Noop by default. Concrete Field classes should implement this method.

Example:

```
class TitleCase(Field):  
    def _serialize(self, value, attr, obj, **kwargs):  
        if not value:  
            return None  
        else:  
            return value.title()
```

(continues on next page)

(continued from previous page)

```
    return ''
    return str(value).title()
```

### Parameters

- **value** – The value to be serialized.
- **attr (str)** – The attribute or key on the object to be serialized.
- **obj (object)** – The object the value was pulled from.
- **kwargs (dict)** – Field-specific keyword arguments.

**Returns** The serialized value

**\_validate(value)**

Perform validation on *value*. Raise a `ValidationError` if validation does not succeed.

**property \_validate\_all**

**\_validate\_missing(value)**

Validate missing values. Raise a `ValidationError` if *value* should be considered missing.

**property context**

The context dictionary for the parent Schema.

**property default**

**default\_error\_messages = {'null': 'Field may not be null.', 'required': 'Missing data for required field.', 'validator\_failed': 'Invalid value.'}**

Default error messages for various kinds of errors. The keys in this dictionary are passed to `Field.make_error`. The values are error messages passed to `marshmallow.exceptions.ValidationError`.

**deserialize(value: Any, attr: Optional[str] = None, data: Optional[Mapping[str, Any]] = None, \*\*kwargs)**  
Deserialize *value*.

### Parameters

- **value** – The value to deserialize.
- **attr** – The attribute/key in *data* to deserialize.
- **data** – The raw input data passed to `Schema.load`.
- **kwargs** – Field-specific keyword arguments.

**Raises ValidationError** – If an invalid value is passed or if a required value is missing.

**fail(key: str, \*\*kwargs)**

Helper method that raises a `ValidationError` with an error message from `self.error_messages`.

Deprecated since version 3.0.0: Use `make_error <marshmallow.fields.Field.make_error>` instead.

**get\_value(obj, attr, accessor=None, default=<marshmallow.missing>)**  
Return the value for a given key from an object.

### Parameters

- **obj (object)** – The object to get the value from.
- **attr (str)** – The attribute/key in *obj* to get the value from.

- **accessor** (*callable*) – A callable used to retrieve the value of *attr* from the object *obj*. Defaults to `marshmallow.utils.get_value`.

**make\_error**(*key: str, \*\*kwargs*) → `marshmallow.exceptions.ValidationError`

Helper method to make a *ValidationError* with an error message from `self.error_messages`.

**property missing**

**name** = `None`

**parent** = `None`

**root** = `None`

**serialize**(*attr: str, obj: Any, accessor: Optional[Callable[[Any, str, Any], Any]] = None, \*\*kwargs*)

Pulls the value for the given key from the object, applies the field's formatting and returns the result.

#### Parameters

- **attr** – The attribute/key to get from the object.
- **obj** – The object to access the attribute/key from.
- **accessor** – Function used to access values from *obj*.
- **kwargs** – Field-specific keyword arguments.

## 2.1.9 app.services

### Description

Registers services for managing business logic.

---

**app.utils.constants****Description****Attributes**

## flask\_api

---

`MS_EXCEL_MIME_TYPE`

REQUEST\_QUERY\_DELIMITER is used for converting requests field values to a list, for example: Request send these values: field\_operator: contains field\_values: valueA;valueB;valueC

---

### `app.utils.constants.MS_EXCEL_MIME_TYPE`

```
app.utils.constants.MS_EXCEL_MIME_TYPE =  
'application/vnd.openxmlformats-officedocument.spreadsheetml.sheet'
```

REQUEST\_QUERY\_DELIMITER is used for converting requests field values to a list, for example:

**Request send these values:** field\_operator: contains field\_values: valueA;valueB;valueC

**The delimiter operator splits values to a list of values:** field\_values: [valueA, valueB, valueC]

```
app.utils.constants.MS_EXCEL_MIME_TYPE =
```

```
'application/vnd.openxmlformats-officedocument.spreadsheetml.sheet'
```

REQUEST\_QUERY\_DELIMITER is used for converting requests field values to a list, for example:

**Request send these values:** field\_operator: contains field\_values: valueA;valueB;valueC

**The delimiter operator splits values to a list of values:** field\_values: [valueA, valueB, valueC]

## `app.utils.decorators`

### Description

### Functions

---

`token_required(fnc)`

---

### `app.utils.decorators.token_required`

```
app.utils.decorators.token_required(fnc)

convert_to(folder, source)
```

---

```
libreoffice_exec()
```

---

## app.utils.libreoffice.convert\_to

```
app.utils.libreoffice.convert_to(folder: str, source: str) → str
```

## app.utils.libreoffice.libreoffice\_exec

```
app.utils.libreoffice.libreoffice_exec() → str
```

### Exceptions

---

```
LibreOfficeError(output)
```

---

## app.utils.libreoffice.LibreOfficeError

```
exception app.utils.libreoffice.LibreOfficeError(output)
exception app.utils.libreoffice.LibreOfficeError(output)
```

args

with\_traceback()

Exception.with\_traceback(tb) – set self.\_\_traceback\_\_ to tb and return self.

app.utils.libreoffice.convert\_to(folder: str, source: str) → str

app.utils.libreoffice.libreoffice\_exec() → str

## app.utils.request\_query\_operator

### Description

Module for creating a Peewee filter query via dynamic way.

Next module is used for creating a Peewee query based on request fields.

### References

Query operators [http://docs.peewee-orm.com/en/latest/peewee/query\\_operators.html](http://docs.peewee-orm.com/en/latest/peewee/query_operators.html)

### Classes

---

*Helper()*

---

*RequestQueryOperator()*

---

## app.utils.request\_query\_operator.Helper

```
class app.utils.request_query_operator.Helper
    Bases: object
```

### Methods

---

*Helper.\_\_init\_\_()*

---

*Helper.build\_clause\_operators(field,*  
...)

---

*Helper.build\_order\_by(db\_model, re-* Build sorting fields with zero or more Column-  
quest\_data) like objects to order by.

---

*Helper.build\_sql\_expression(field, ...)*

---

continues on next page

Table 147 – continued from previous page

`Helper.build_string_clause(field, ...)` Build string clauses.

---

### `app.utils.request_query_operator.Helper.__init__`

`Helper.__init__(...)`

### `app.utils.request_query_operator.Helper.build_clause_operators`

`Helper.build_clause_operators(field: peewee.Field, field_operator: str, field_value) → tuple`

### `app.utils.request_query_operator.Helper.build_order_by`

`static Helper.build_order_by(db_model: Type[peewee.Model], request_data: dict) → list`  
Build sorting fields with zero or more Column-like objects to order by.

#### Example

Peewee query: `User.select().order_by(User.created_at.asc())`

```
Request fields:  >>> from app.models.user import User >>> db_model = User
>>> request_data = {'order': [{‘sorting’: ‘asc’, ‘field_name’: ‘created_at’}]} >>>
Helper.build_order_by(db_model, request_data) [<peewee.Ordering object at ...>]
```

#### Notes

Actually is not possible to order across joins.

#### References

<http://docs.peewee-orm.com/en/latest/peewee/querying.html#sorting-records>

[http:](http://docs.peewee-orm.com/en/latest/peewee/api.html#Query.order_by)

### `app.utils.request_query_operator.Helper.build_sql_expression`

`Helper.build_sql_expression(field: peewee.Field, field_operator: str, field_value)`

### `app.utils.request_query_operator.Helper.build_string_clause`

`Helper.build_string_clause(field: peewee.Field, field_operator: str, field_value) → tuple`  
Build string clauses.

You can find next string operators: +————+————+ | Name  
| Description | +=====+=====+=====+ |  
| eq | x equals y | +————+————+ | ne | x is not equal to y  
| +————+————+ | contains | Wild-card search for substring |  
+————+————+ | ncontains | Wild-card not search for substring |  
+————+————+ | startswith | Search for values beginning with |

prefix | +—————+—————+ | ends with | Search for values ending  
with suffix | +—————+—————+ |

### Example

TODO: Pending to define

## app.utils.request\_query\_operator.RequestQueryOperator

```
class app.utils.request_query_operator.RequestQueryOperator  
Bases: object
```

### Methods

---

```
RequestQueryOperator.__init__()
```

---

```
RequestQueryOperator.  
create_search_query(...)  
RequestQueryOperator.  
get_request_query_fields(...)
```

---

## app.utils.request\_query\_operator.RequestQueryOperator.\_\_init\_\_

```
RequestQueryOperator.__init__()
```

## app.utils.request\_query\_operator.RequestQueryOperator.create\_search\_query

```
static RequestQueryOperator.create_search_query(db_model: Type[peewee.Model],  
query: peewee.ModelSelect, data:  
Optional[dict] = None) →  
peewee.ModelSelect
```

## app.utils.request\_query\_operator.RequestQueryOperator.get\_request\_query\_fields

```
static RequestQueryOperator.get_request_query_fields(db_model:  
Type[peewee.Model],  
request_data=None) → tuple
```

## class app.utils.request\_query\_operator.Helper

```
build_clause_operators(field: peewee.Field, field_operator: str, field_value) → tuple
```

```
static build_order_by(db_model: Type[peewee.Model], request_data: dict) → list  
Build sorting fields with zero or more Column-like objects to order by.
```

### Example

Peewee query: User.select().order\_by(User.created\_at.asc())

```
Request fields: >>> from app.models.user import User >>> db_model = User >>> request_data = {‘order’: [{‘sorting’: ‘asc’, ‘field_name’: ‘created_at’}]} >>> Helper.build_order_by(db_model, request_data)  
[<peewee.Ordering object at ...>]
```

### Notes

Actually is not possible to order across joins.

### References

**build\_sql\_expression**(*field*: peewee.Field, *field\_operator*: str, *field\_value*)

**build\_string\_clause**(*field*: peewee.Field, *field\_operator*: str, *field\_value*) → tuple

Build string clauses.

You can find next string operators:	+-----+-----+-----+-----+   Name
Description   +=====+=====+=====+=====+	
eq   x equals y   +-----+-----+-----+-----+   ne   x is not equal to y	
+-----+-----+-----+-----+   contains   Wild-card search for substring	
+-----+-----+-----+-----+   ncontains   Wild-card not search for substring	
+-----+-----+-----+-----+   startswith   Search for values beginning with prefix	
+-----+-----+-----+-----+   endswith   Search for values ending with suffix	
+-----+-----+-----+-----+	

### Example

TODO: Pending to define

```
class app.utils.request_query_operator.RequestQueryOperator

    static create_search_query(db_model: Type[peewee.Model], query: peewee.ModelSelect, data:
        Optional[dict] = None) → peewee.ModelSelect

    static get_request_query_fields(db_model: Type[peewee.Model], request_data=None) → tuple
```

### Functions

---

*filter\_by\_keys*(*data*, *keys*)

---

*find\_longest\_word*(*word\_list*)

---

*get\_attr\_from\_module*(*module*, *attr*)                          Get attribute from a module.

---

*get\_request\_file*([*field\_name*])

---

continues on next page

Table 149 – continued from previous page

---

<code>ignore_keys(data, exclude)</code>
<code>pos_to_char(pos)</code>
<code>to_readable(obj)</code>

---

### app.utils.filter\_by\_keys

`app.utils.filter_by_keys(data: dict, keys: list) → dict`

### app.utils.find\_longest\_word

`app.utils.find_longest_word(word_list: list) → str`

### app.utils.get\_attr\_from\_module

`app.utils.get_attr_from_module(module: str, attr: str) → any`

Get attribute from a module.

#### Parameters

- **module (str)** – Module absolute path.
- **attr (str)** – Module's attribute. It could be any kind of variable belongs to module.

#### Examples

```
>>> from app.utils import get_attr_from_module
>>> module_path = 'app.blueprints.base'
>>> module_attr = 'blueprint'
>>> get_attr_from_module(module_path, module_attr)
<flask.blueprints.Blueprint object at ...>
```

#### Raises

- **ImportError** – Module doesn't exist.
- **AttributeError** – Attribute doesn't exist in module.

### app.utils.get\_request\_file

`app.utils.get_request_file(field_name: Optional[str] = None) → dict`

## app.utils.ignore\_keys

app.utils.ignore\_keys(*data: dict, exclude: list*) → dict

## app.utils.pos\_to\_char

app.utils.pos\_to\_char(*pos: int*) → str

## app.utils.to\_readable

app.utils.to\_readable(*obj: object*) → object

app.utils.filter\_by\_keys(*data: dict, keys: list*) → dict

app.utils.find\_longest\_word(*word\_list: list*) → str

app.utils.get\_attr\_from\_module(*module: str, attr: str*) → any

Get attribute from a module.

### Parameters

- **module (str)** – Module absolute path.
- **attr (str)** – Module's attribute. It could be any kind of variable belongs to module.

## Examples

```
>>> from app.utils import get_attr_from_module
>>> module_path = 'app.blueprints.base'
>>> module_attr = 'blueprint'
>>> get_attr_from_module(module_path, module_attr)
<flask.blueprints.Blueprint object at ...>
```

### Raises

- **ImportError** – Module doesn't exist.
- **AttributeError** – Attribute doesn't exist in module.

app.utils.get\_request\_file(*field\_name: Optional[str] = None*) → dict

app.utils.ignore\_keys(*data: dict, exclude: list*) → dict

app.utils.pos\_to\_char(*pos: int*) → str

app.utils.to\_readable(*obj: object*) → object

## Functions

---

<code>create_app(env_config)</code>	Builds an application based on environment configuration.
-------------------------------------	---

---

### 2.1.12 app.create\_app

`app.create_app(env_config: str) → flask.app.Flask`  
Builds an application based on environment configuration.

**Parameters** `env_config` – Environment configuration.

**Returns** A `flask.flask` instance.

**Return type** Flask

#### Notes

Environment configuration values could be:

```
config.ProdConfig  
config.DevConfig  
config.TestConfig
```

`app._init_logging(app: flask.app.Flask) → None`  
`app._register_blueprints(app: flask.app.Flask) → None`  
`app.create_app(env_config: str) → flask.app.Flask`  
Builds an application based on environment configuration.

**Parameters** `env_config` – Environment configuration.

**Returns** A `flask.flask` instance.

**Return type** Flask

#### Notes

Environment configuration values could be:

```
config.ProdConfig  
config.DevConfig  
config.TestConfig
```

## 2.2 database

### Description

Package for managing the database.

The database package can creates and migrates tables and it can fills them with fake data.

### Modules

<code>database.factories</code>	Package contains factories modules.
<code>database.migrations</code>	
<code>database.seeds</code>	

### 2.2.1 database.factories

#### Description

Package contains factories modules.

A factory is a database model filled with fake data. The factory purposes is creating records in a simple way.

The module is used in testing and seeds.

#### References

The factory concept is based on [Laravel factories](#)

#### Classes

<code>Factory(model_name[, records])</code>	Class for managing factories based on database models.
---	--

#### database.factories.Factory

**class** `database.factories.Factory(model_name: str, records: int = 1)`  
Bases: `object`

Class for managing factories based on database models.

Create and save instances of database models or dicts based on database models registered in the application.

`make(self, params: dict = None, to_dict: bool = False, exclude: list = None)`  
Create instances of database models with fake data.

`save(self, params: dict = None)`  
Save instances of database models in the database.

## Examples

How to create a fake user without save in database from command line:

```
source venv/bin/activate
flask shell
>>> user_factory = Factory('User')
>>> user = user_factory.make() # An instance of database model
<User: None>
>>> user.__data__ # You can see user data on this way
```

Oh, Wait!

```
>>> from pprint import pprint
>>> pprint(user.__data__) # Even better!
```

You can save the user in the database.

```
>>> user.save()
1
```

Factory can create a dictionary instead of an instance of database model.

```
>>> user = user_factory.make(to_dict=True)
>>> pprint(user)
```

Also can set params too.

```
>>> user_factory = Factory('User')
>>> user = user_factory.make({'name': 'Ruben', 'last_name': 'Rodriguez'})
>>> user.name
'Ruben'
>>> user.last_name
'Rodriguez'
```

Factory allow to make many users in once time.

```
>>> user_factory = Factory('User', 3)
>>> users = user_factory.make()
[<User: None>, <User: None>, <User: None>]
```

If you want to fill some params later then you can pass a fieldnames list to the factory of thots fields that you don't want to fill yet.

```
>>> user_factory = Factory('User')
>>> user = user_factory.make(exclude=['name', 'birth_date'])
>>> user.name
None
>>> user.birth_date
None
```

If you only need to save data you can do it.

```
>>> Factory('User', 3).save()
[<User: 1>, <User: 2>, <User: 3>]
```

And you can set params for all users.

```
>>> Factory('User', 3).save({'name': 'Ruben'})
[<User: 4>, <User: 5>, <User: 6>]
```

## Methods

<code>Factory.__init__(model_name[, records])</code>	Register as many factories as given records.
<code>Factory.make([params, to_dict, exclude])</code>	Create instances of database model with fake data.
<code>Factory.save([params])</code>	Save instances of database model in the database.

### database.factories.Factory.\_\_init\_\_

`Factory.__init__(model_name: str, records: int = 1)`

Register as many factories as given records.

### database.factories.Factory.make

`Factory.make(params: Optional[dict] = None, to_dict: bool = False, exclude: Optional[list] = None) → any`

Create instances of database model with fake data.

#### Parameters

- **params (dict)** – Params to set when an instance of database model is created.
- **to\_dict (bool)** – If is True returns a dict otherwise is an instance of database model. By default is False.
- **exclude (list)** – Params are not going to be filled. These fields are equals to None.

**Returns** Could be a dict, a list or an instance of database model.

**Return type** any

### database.factories.Factory.save

`Factory.save(params: Optional[dict] = None) → any`

Save instances of database model in the database.

**Parameters** **params (dict)** – Params to set when an instance of database model is created.

**Returns** Could be a list or an instance of database model.

**Return type** any

`class database.factories.Factory(model_name: str, records: int = 1)`

Class for managing factories based on database models.

Create and save instances of database models or dicts based on database models registered in the application.

`make(self, params: dict = None, to_dict: bool = False, exclude: list = None)`

Create instances of database models with fake data.

```
save(self, params: dict = None)
    Save instances of database models in the database.
```

## Examples

How to create a fake user without save in database from command line:

```
source venv/bin/activate
flask shell
>>> user_factory = Factory('User')
>>> user = user_factory.make() # An instance of database model
<User: None>
>>> user.__data__ # You can see user data on this way
```

Oh, Wait!

```
>>> from pprint import pprint
>>> pprint(user.__data__) # Even better!
```

You can save the user in the database.

```
>>> user.save()
1
```

Factory can create a dictionary instead of an instance of database model.

```
>>> user = user_factory.make(to_dict=True)
>>> pprint(user)
```

Also can set params too.

```
>>> user_factory = Factory('User')
>>> user = user_factory.make({'name': 'Ruben', 'last_name': 'Rodriguez'})
>>> user.name
'Ruben'
>>> user.last_name
'Rodriguez'
```

Factory allow to make many users in once time.

```
>>> user_factory = Factory('User', 3)
>>> users = user_factory.make()
[<User: None>, <User: None>, <User: None>]
```

If you want to fill some params later then you can pass a fieldnames list to the factory of thots fields that you don't want to fill yet.

```
>>> user_factory = Factory('User')
>>> user = user_factory.make(exclude=['name', 'birth_date'])
>>> user.name
None
>>> user.birth_date
None
```

If you only need to save data you can do it.

```
>>> Factory('User', 3).save()
[<User: 1>, <User: 2>, <User: 3>]
```

And you can set params for all users.

```
>>> Factory('User', 3).save({'name': 'Ruben'})
[<User: 4>, <User: 5>, <User: 6>]
```

```
__check_exists_factory(factory_classname: str, model_name: str) → None
__current_module = 'database.factories'
__models: list = None
make(params: Optional[dict] = None, to_dict: bool = False, exclude: Optional[list] = None) → any
Create instances of database model with fake data.
```

#### Parameters

- **params** (*dict*) – Params to set when an instance of database model is created.
- **to\_dict** (*bool*) – If is True returns a dict otherwise is an instance of database model. By default is False.
- **exclude** (*list*) – Params are not going to be filled. These fields are equals to None.

**Returns** Could be a dict, a list or an instance of database model.

**Return type** any

```
save(params: Optional[dict] = None) → any
```

Save instances of database model in the database.

**Parameters** **params** (*dict*) – Params to set when an instance of database model is created.

**Returns** Could be a list or an instance of database model.

**Return type** any

## 2.2.2 database.migrations

### Description

### Modules

---

```
database.migrations.

database.seed_actions(fnc)
```

## 2.3 tests

### Description

Package for testing the application.

The tests package stores the application's tests that are executed for ensuring the proper behaviour of the application.

You can get report coverage statistics with coverage package.

### Notes

There are three kinds of tests created:

1. **Unit testing** Unit testing means testing individual modules of an application in isolation (without any interaction with dependencies) to confirm that the code is doing things right.
2. **Integration testing** Integration testing means checking if different modules are working fine when combined together as a group.
3. **Functional testing** Functional testing means testing a slice of functionality in the system (may interact with dependencies) to confirm that the code is doing the right things.

Let us understand these three types of testing with an oversimplified example.

E.g. For a functional mobile phone, the main parts required are “battery” and “sim card”.

Unit testing Example – The battery is checked for its life, capacity and other parameters. Sim card is checked for its activation.

Integration Testing Example – Battery and sim card are integrated i.e. assembled in order to start the mobile phone.

Functional Testing Example – The functionality of a mobile phone is checked in terms of its features and battery usage as well as sim card facilities.

### References

The Differences Between Unit Testing, Integration Testing and Functional Testing.

## Examples

How to usage:

```
source venv/bin/activate  
pytest
```

How to call a specific test:

```
source venv/bin/activate  
pytest tests/blueprints/test_base.py
```

How to call a specific test function:

```
source venv/bin/activate  
pytest -k test_welcome_api
```

You can use coverage package for running tests as well:

```
source venv/bin/activate  
coverage run -m pytest
```

And get a report coverage statistics on modules:

```
source venv/bin/activate  
coverage report -m
```

For a nicer presentation, use coverage html to get annotated HTML listings detailing missed lines:

```
source venv/bin/activate  
coverage html
```

## References

How can I test Celery tasks?

Depends on what exactly you want to be testing.

- Test the task code directly. Don't call "task.delay(...)" just call "task(...)" from your unit tests.
- Use CELERY\_ALWAYS\_EAGER. This will cause your tasks to be called immediately at the point you say "task.delay(...)", so you can test the whole path (but not any asynchronous behavior).

<https://stackoverflow.com/questions/12078667/how-do-you-unit-test-a-celery-task>

## Modules

<code>tests.blueprints</code>	Package for testing blueprints.
<code>tests.celery</code>	Package for testing Celery tasks.
<code>tests.conftest</code>	Module for configuring Pytest.
<code>tests.custom_flask_client</code>	
<code>tests.test_config</code>	Module for testing Config module. continues on next page

Table 183 – continued from previous page

<code>tests.test_db</code>	Module for testing database.
<code>tests.test_mail</code>	Module for testing mail.

## 2.3.2 tests.celery

### Description

Package for testing Celery tasks.

### Modules

---

```
tests.celery.test_celery
```

---

<code>tests.celery.test_excel</code>	Module for testing excel module.
--------------------------------------	----------------------------------

<code>tests.celery.test_tasks</code>	Module for testing task module.
--------------------------------------	---------------------------------

<code>tests.celery.test_word</code>	Module for testing word module.
-------------------------------------	---------------------------------

---

### tests.celery.test\_celery

#### Description

#### Functions

---

```
test_register_context_task(app)
```

---

[\*\*tests.celery.test\\_celery.test\\_register\\_context\\_task\*\*](#)

```
tests.celery.test_celery.test_register_context_task(app: flask.app.Flask)  
tests.celery.test_celery.test_register_context_task(app: flask.app.Flask)
```

[\*\*tests.celery.test\\_excel\*\*](#)

**Description**

Module for testing excel module.

**Functions**

---

```
test\_export\_excel\_task(app)
```

---

[\*\*tests.celery.test\\_excel.test\\_export\\_excel\\_task\*\*](#)

```
tests.celery.test_excel.test_export_excel_task(app: flask.app.Flask)  
tests.celery.test_excel.test_export_excel_task(app: flask.app.Flask)
```

[\*\*tests.celery.test\\_tasks\*\*](#)

**Description**

Module for testing task module.

**Functions**

---

```
test\_create\_user\_email\_task(factory)
```

---

```
test\_create\_word\_and\_excel\_documents(app)
```

---

```
test\_reset\_password\_email\_task(app)
```

---

```
test\_send\_email\_with\_attachments\_task(app)
```

---

**tests.celery.test\_tasks.test\_create\_user\_email\_task**

```
tests.celery.test_tasks.test_create_user_email_task(factory: any)
```

**tests.celery.test\_tasks.test\_create\_word\_and\_excel\_documents**

```
tests.celery.test_tasks.test_create_word_and_excel_documents(app: flask.app.Flask)
```

**tests.celery.test\_tasks.test\_reset\_password\_email\_task**

```
tests.celery.test_tasks.test_reset_password_email_task(app: flask.app.Flask)
```

**tests.celery.test\_tasks.test\_send\_email\_with\_attachments\_task**

```
tests.celery.test_tasks.test_send_email_with_attachments_task(app: flask.app.Flask)
```

```
tests.celery.test_tasks.test_create_user_email_task(factory: any)
```

```
tests.celery.test_tasks.test_create_word_and_excel_documents(app: flask.app.Flask)
```

```
tests.celery.test_tasks.test_reset_password_email_task(app: flask.app.Flask)
```

```
tests.celery.test_tasks.test_send_email_with_attachments_task(app: flask.app.Flask)
```

**tests.celery.test\_word****Description**

Module for testing word module.

**Functions**

---

```
test_export_word_task(app)
```

---

**tests.celery.test\_word.test\_export\_word\_task**

```
tests.celery.test_word.test_export_word_task(app: flask.app.Flask)
```

```
tests.celery.test_word.test_export_word_task(app: flask.app.Flask)
```

### 2.3.3 tests.conftest

#### Description

Module for configuring Pytest.

#### Functions

<code>app()</code>	Create an app with testing environment.
<code>auth_header(app, client)</code>	Create an auth header from a given user that can be added to an http requests.
<code>client(app)</code>	Create a test client for making http requests.
<code>factory(app)</code>	Create a Factory from a database model.
<code>runner(app)</code>	Create a CLI runner for testing CLI commands.

#### tests.conftest.app

`tests.conftest.app()`

Create an app with testing environment.

#### tests.conftest.auth\_header

`tests.conftest.auth_header(app: flask.app.Flask, client: tests.custom_flask_client.CustomFlaskClient)`

Create an auth header from a given user that can be added to an http requests.

#### tests.conftest.client

`tests.conftest.client(app: flask.app.Flask)`

Create a test client for making http requests.

#### tests.conftest.factory

`tests.conftest.factory(app: flask.app.Flask)`

Create a Factory from a database model.

#### tests.conftest.runner

`tests.conftest.runner(app: flask.app.Flask)`

Create a CLI runner for testing CLI commands.

`tests.conftest._remove_test_files(storage_path: str) → None`

Remove test files created in storage path.

`tests.conftest.app()`

Create an app with testing environment.

`tests.conftest.auth_header(app: flask.app.Flask, client: tests.custom_flask_client.CustomFlaskClient)`

Create an auth header from a given user that can be added to an http requests.

```
tests.conftest.client(app: flask.app.Flask)
    Create a test client for making http requests.

tests.conftest.factory(app: flask.app.Flask)
    Create a Factory from a database model.

tests.conftest.runner(app: flask.app.Flask)
    Create a CLI runner for testing CLI commands.
```

## 2.3.4 tests.custom\_flask\_client

### Description

### Classes

---

```
CustomFlaskClient(*args, **kwargs)
```

---

#### tests.custom\_flask\_client.CustomFlaskClient

```
class tests.custom_flask_client.CustomFlaskClient(*args: Any, **kwargs: Any)
    Bases: flask.testing.FlaskClient
```

##### Attributes

---

```
CustomFlaskClient.preserve_context
```

---

##### tests.custom\_flask\_client.CustomFlaskClient.preserve\_context

```
CustomFlaskClient.preserve_context = False
```

##### Methods

---

```
CustomFlaskClient.__init__(*args,
                           **kwargs)
```

---

```
CustomFlaskClient.
after_request(response)
```

---

```
CustomFlaskClient.
before_request(*args, **kwargs)
```

---

```
CustomFlaskClient.delete(*args, **kwargs)           Like open but method is enforced to DELETE.
```

---

```
CustomFlaskClient.delete_cookie(server_name, key)   Deletes a cookie in the test client.
```

---

```
CustomFlaskClient.get(*args, **kwargs)               Like open but method is enforced to GET.
```

---

```
CustomFlaskClient.head(*args, **kw)                 Call open\(\) with method set to HEAD.
```

---

continues on next page

Table 199 – continued from previous page

<code>CustomFlaskClient. make_request(method, ...)</code>	
<code>CustomFlaskClient.open(*args[, as_tuple, ...])</code>	Generate an environ dict from the given arguments, make a request to the application using it, and return the response.
<code>CustomFlaskClient.options(*args, **kw)</code>	Call <code>open()</code> with method set to OPTIONS.
<code>CustomFlaskClient.patch(*args, **kw)</code>	Call <code>open()</code> with method set to PATCH.
<code>CustomFlaskClient.post(*args, **kwargs)</code>	Like open but method is enforced to POST.
<code>CustomFlaskClient.put(*args, **kwargs)</code>	Like open but method is enforced to PUT.
<code>CustomFlaskClient. resolve_redirect(response)</code>	Perform a new request to the location given by the redirect response to the previous request.
<code>CustomFlaskClient. run_wsgi_app(environ[, ...])</code>	Runs the wrapped WSGI app with the given environment.
<code>CustomFlaskClient. session_transaction(*args, ...)</code>	When used in combination with a <code>with</code> statement this opens a session transaction.
<code>CustomFlaskClient. set_cookie(server_name, key)</code>	Sets a cookie in the client's cookie jar.
<code>CustomFlaskClient.trace(*args, **kw)</code>	Call <code>open()</code> with method set to TRACE.

**tests.custom\_flask\_client.CustomFlaskClient.\_\_init\_\_**`CustomFlaskClient.__init__(*args: Any, **kwargs: Any) → None`**tests.custom\_flask\_client.CustomFlaskClient.after\_request**`static CustomFlaskClient.after_request(response: flask.wrappers.Response)`**tests.custom\_flask\_client.CustomFlaskClient.before\_request**`static CustomFlaskClient.before_request(*args, **kwargs)`**tests.custom\_flask\_client.CustomFlaskClient.delete**`CustomFlaskClient.delete(*args, **kwargs)`

Like open but method is enforced to DELETE.

**tests.custom\_flask\_client.CustomFlaskClient.delete\_cookie**`CustomFlaskClient.delete_cookie(server_name: str, key: str, path: str = '/', domain:  
Optional[str] = None, secure: bool = False, httponly:  
bool = False, samesite: Optional[str] = None) → None`

Deletes a cookie in the test client.

**tests.custom\_flask\_client.CustomFlaskClient.get**

`CustomFlaskClient.get(*args, **kwargs)`

Like open but method is enforced to GET.

**tests.custom\_flask\_client.CustomFlaskClient.head**

`CustomFlaskClient.head(*args: Any, **kw: Any) → werkzeug.test.TestResponse`

Call [open\(\)](#) with method set to HEAD.

**tests.custom\_flask\_client.CustomFlaskClient.make\_request**

`CustomFlaskClient.make_request(method: str, *args, **kwargs)`

**tests.custom\_flask\_client.CustomFlaskClient.open**

`CustomFlaskClient.open(*args: Any, as_tuple: bool = False, buffered: bool = False, follow_redirects: bool = False, **kwargs: Any) → Response`

Generate an environ dict from the given arguments, make a request to the application using it, and return the response.

**Parameters**

- **args** – Passed to `EnvironBuilder` to create the environ for the request. If a single arg is passed, it can be an existing `EnvironBuilder` or an environ dict.
- **buffered** – Convert the iterator returned by the app into a list. If the iterator has a `close()` method, it is called automatically.
- **follow\_redirects** – Make additional requests to follow HTTP redirects until a non-redirect status is returned. `TestResponse.history` lists the intermediate responses.

Changed in version 2.0: `as_tuple` is deprecated and will be removed in Werkzeug 2.1. Use `TestResponse.request` and `request.environ` instead.

Changed in version 2.0: The request input stream is closed when calling `response.close()`. Input streams for redirects are automatically closed.

Changed in version 0.5: If a dict is provided as file in the dict for the `data` parameter the content type has to be called `content_type` instead of `mimetype`. This change was made for consistency with `werkzeug.FileWrapper`.

Changed in version 0.5: Added the `follow_redirects` parameter.

**tests.custom\_flask\_client.CustomFlaskClient.options**

`CustomFlaskClient.options(*args: Any, **kw: Any) → werkzeug.test.TestResponse`

Call [open\(\)](#) with method set to OPTIONS.

**tests.custom\_flask\_client.CustomFlaskClient.patch**

`CustomFlaskClient.patch(*args: Any, **kw: Any) → werkzeug.test.TestResponse`  
Call `open()` with method set to PATCH.

**tests.custom\_flask\_client.CustomFlaskClient.post**

`CustomFlaskClient.post(*args, **kwargs)`  
Like open but method is enforced to POST.

**tests.custom\_flask\_client.CustomFlaskClient.put**

`CustomFlaskClient.put(*args, **kwargs)`  
Like open but method is enforced to PUT.

**tests.custom\_flask\_client.CustomFlaskClient.resolve\_redirect**

`CustomFlaskClient.resolve_redirect(response: werkzeug.test.TestResponse, buffered: bool = False) → werkzeug.test.TestResponse`  
Perform a new request to the location given by the redirect response to the previous request.

**tests.custom\_flask\_client.CustomFlaskClient.run\_wsgi\_app**

`CustomFlaskClient.run_wsgi_app(environ: WSGIEnvironment, buffered: bool = False) → Tuple[Iterable[bytes], str, werkzeug.datastructures.Headers]`  
Runs the wrapped WSGI app with the given environment.

**tests.custom\_flask\_client.CustomFlaskClient.session\_transaction**

`CustomFlaskClient.session_transaction(*args: Any, **kwargs: Any) → Generator[flask.sessions.SessionMixin, None, None]`

When used in combination with a `with` statement this opens a session transaction. This can be used to modify the session that the test client uses. Once the `with` block is left the session is stored back.

```
with client.session_transaction() as session:  
    session['value'] = 42
```

Internally this is implemented by going through a temporary test request context and since session handling could depend on request variables this function accepts the same arguments as `test_request_context()` which are directly passed through.

**tests.custom\_flask\_client.CustomFlaskClient.set\_cookie**

```
CustomFlaskClient.set_cookie(server_name: str, key: str, value: str = "", max_age:  
    Optional[Union[datetime.timedelta, int]] = None, expires:  
    Optional[Union[str, datetime.datetime, int, float]] = None,  
    path: str = '/', domain: Optional[str] = None, secure: bool =  
    False, httponly: bool = False, samesite: Optional[str] =  
    None, charset: str = 'utf-8') → None
```

Sets a cookie in the client's cookie jar. The server name is required and has to match the one that is also passed to the open call.

**tests.custom\_flask\_client.CustomFlaskClient.trace**

```
CustomFlaskClient.trace(*args: Any, **kw: Any) → werkzeug.test.TestResponse  
Call open\(\) with method set to TRACE.
```

```
class tests.custom_flask_client.CustomFlaskClient(*args: Any, **kwargs: Any)
```

```
static after_request(response: flask.wrappers.Response)
```

```
application: Flask
```

```
static before_request(*args, **kwargs)
```

```
delete(*args, **kwargs)
```

Like open but method is enforced to DELETE.

```
delete_cookie(server_name: str, key: str, path: str = '/', domain: Optional[str] = None, secure: bool =  
    False, httponly: bool = False, samesite: Optional[str] = None) → None
```

Deletes a cookie in the test client.

```
get(*args, **kwargs)
```

Like open but method is enforced to GET.

```
head(*args: Any, **kw: Any) → werkzeug.test.TestResponse
```

Call [open\(\)](#) with method set to HEAD.

```
make_request(method: str, *args, **kwargs)
```

```
open(*args: Any, as_tuple: bool = False, buffered: bool = False, follow_redirects: bool = False, **kwargs: Any) → Response
```

Generate an environ dict from the given arguments, make a request to the application using it, and return the response.

#### Parameters

- **args** – Passed to EnvironBuilder to create the environ for the request. If a single arg is passed, it can be an existing EnvironBuilder or an environ dict.
- **buffered** – Convert the iterator returned by the app into a list. If the iterator has a `close()` method, it is called automatically.
- **follow\_redirects** – Make additional requests to follow HTTP redirects until a non-redirect status is returned. `TestResponse.history` lists the intermediate responses.

Changed in version 2.0: `as_tuple` is deprecated and will be removed in Werkzeug 2.1. Use `TestResponse.request` and `request.environ` instead.

Changed in version 2.0: The request input stream is closed when calling `response.close()`. Input streams for redirects are automatically closed.

Changed in version 0.5: If a dict is provided as file in the dict for the `data` parameter the content type has to be called `content_type` instead of `mimetype`. This change was made for consistency with `werkzeug.FileWrapper`.

Changed in version 0.5: Added the `follow_redirects` parameter.

**options**(\*args: Any, \*\*kw: Any) → werkzeug.test.TestResponse  
Call `open()` with `method` set to `OPTIONS`.

**patch**(\*args: Any, \*\*kw: Any) → werkzeug.test.TestResponse  
Call `open()` with `method` set to `PATCH`.

**post**(\*args, \*\*kwargs)  
Like `open` but method is enforced to `POST`.

**preserve\_context = False**

**put**(\*args, \*\*kwargs)  
Like `open` but method is enforced to `PUT`.

**resolve\_redirect**(response: werkzeug.test.TestResponse, buffered: bool = False) → werkzeug.test.TestResponse  
Perform a new request to the location given by the redirect response to the previous request.

**run\_wsgi\_app**(environ: WSGIEnvironment, buffered: bool = False) → Tuple[Iterable[bytes], str, werkzeug.datastructures.Headers]  
Runs the wrapped WSGI app with the given environment.

**session\_transaction**(\*args: Any, \*\*kwargs: Any) → Generator[flask.sessions.SessionMixin, None, None]

When used in combination with a `with` statement this opens a session transaction. This can be used to modify the session that the test client uses. Once the `with` block is left the session is stored back.

```
with client.session_transaction() as session:  
    session['value'] = 42
```

Internally this is implemented by going through a temporary test request context and since session handling could depend on request variables this function accepts the same arguments as `test_request_context()` which are directly passed through.

**set\_cookie**(server\_name: str, key: str, value: str = "", max\_age: Optional[Union[datetime.timedelta, int]] = None, expires: Optional[Union[str, datetime.datetime, int, float]] = None, path: str = '/', domain: Optional[str] = None, secure: bool = False, httponly: bool = False, samesite: Optional[str] = None, charset: str = 'utf-8') → None

Sets a cookie in the client's cookie jar. The server name is required and has to match the one that is also passed to the `open` call.

**trace**(\*args: Any, \*\*kw: Any) → werkzeug.test.TestResponse  
Call `open()` with `method` set to `TRACE`.

### 2.3.5 tests.test\_config

#### Description

Module for testing Config module.

#### Functions

---

<code>test_config()</code>	Check if TESTING attribute is enabled.
----------------------------	--

---

#### `tests.test_config.test_config`

##### `tests.test_config.test_config()`

Check if TESTING attribute is enabled.

##### `tests.test_config.test_config()`

Check if TESTING attribute is enabled.

### 2.3.6 tests.test\_db

#### Description

Module for testing database.

#### Functions

---

<code>test_get_close_db()</code>	Check if a database connection is closed.
----------------------------------	---

---

#### `tests.test_db.test_get_close_db`

##### `tests.test_db.test_get_close_db()`

Check if a database connection is closed.

##### `tests.test_db.test_get_close_db()`

Check if a database connection is closed.

### 2.3.7 tests.test\_mail

#### Description

Module for testing mail.

## flask\_api

---

### Functions

---

<code>test_mail_record_messages(app)</code>	Check if a email is sent.
---	---------------------------

---

#### **tests.test\_mail.test\_mail\_record\_messages**

`tests.test_mail.test_mail_record_messages(app)`

Check if a email is sent.

### References

Unit tests and suppressing emails

`tests.test_mail.test_mail_record_messages(app)`

Check if a email is sent.

### References

Unit tests and suppressing emails

## 2.3.8 tests.test\_middleware

### Description

### Functions

---

<code>test_api_middleware(client, auth_header)</code>
---

---

---

<code>test_no_api_middleware(client)</code>
---

---

#### **tests.test\_middleware.test\_api\_middleware**

`tests.test_middleware.test_api_middleware(client: tests.custom_flask_client.CustomFlaskClient,  
auth_header: any)`

#### **tests.test\_middleware.test\_no\_api\_middleware**

`tests.test_middleware.test_no_api_middleware(client: tests.custom_flask_client.CustomFlaskClient)`

`tests.test_middleware.test_api_middleware(client: tests.custom_flask_client.CustomFlaskClient,  
auth_header: any)`

`tests.test_middleware.test_no_api_middleware(client: tests.custom_flask_client.CustomFlaskClient)`

## 2.4 config

### Description

Module loads the application's configuration.

The extension and custom configurations are defined here.

### Classes

<i>Config()</i>	Default configuration options.
<i>DevConfig()</i>	Development configuration options.
<i>Meta(name, bases, dict)</i>	Metaclass for updating Config options.
<i>ProdConfig()</i>	Production configuration options.
<i>TestConfig()</i>	Testing configuration options.

### 2.4.1 config.Config

```
class config.Config  
    Bases: object  
  
    Default configuration options.
```

#### Attributes

---

*Config.ALLOWED\_CONTENT\_TYPES*

---

*Config.ALLOWED\_MIME\_TYPES*

---

*Config.DATABASE*

---

*Config.DEBUG*

---

*Config.DEVELOPMENT*

---

**CHAPTER  
THREE**

---

## **FLASK COMMAND LINE**

Flask command line allow run scripts for managing database, start up task queues, etc.

You don't need to start up the server for running these scripts but you must activate your virtual environment.

## CHANGELOG

All notable changes to this project will be documented in this file. See [standard-version](#) for commit guidelines.

### 4.1 2.0.6 (2021-12-28)

#### 4.2 Bug Fixes

- **pip:** upgrade package versions ([75aff3b](#))

### 4.3 2.0.5 (2021-12-27)

#### 4.4 Bug Fixes

- **npm:** upgrade package versions ([f62f335](#))

#### 4.4.1 2.0.4 (2021-02-19)

#### 4.5 Bug Fixes

- **users:** add new fs\_uniquifier column on users table ([a28be38](#))

### 4.6 Build System

- **npm:** update node package versions ([6314da3](#))
- **pip:** update flask-security-too version to 4.0.0 ([698acb6](#))
- **pip:** update python package versions ([09755c8](#))

#### 4.6.1 2.0.3 (2021-02-05)

### 4.7 Bug Fixes

- **celery:** task fields are saving on database when the task is finished ([bc93505](#))

### 4.8 Code Refactoring

- add new mockups directory in storage directory ([91e642e](#))
- tls and ssl flask mail are getting from environment file ([e548d57](#))

#### 4.8.1 2.0.2 (2021-01-23)

### 4.9 Bug Fixes

- **celery:** new settings name are not applies on celery 4.4.7 ([f1a0bff](#))
- **middleware:** correct middleware for allowing to let in Swagger ([441b077](#))
- **tasks:** correct task for sending an email with attachments ([43d516c](#))

### 4.10 Build System

- **pip:** update python dependencies ([8964eed](#))

### 4.11 Code Refactoring

- **blueprints:** update way to register all blueprints ([b7692b2](#))
- update way to test Celery tasks ([eb3f72d](#))
- **celery:** update way to run Celery ([dee133d](#))
- **factories:** update way to create a model instance from a factory ([ddfcbb7d](#))
- **swagger:** update order field format ([ccbfcda](#))
- **tasks:** exclude internal\_filename in Celery tasks ([53dcf6d](#))

#### 4.11.1 2.0.1 (2021-01-05)

### 4.12 Bug Fixes

- **tasks:** correct output data on serializers and swagger ([d5c050a](#))

### 4.13 Build System

- **npm:** update npm dependencies for fixing a vulnerability found ([15ee5de](#))
- **pip:** update Python packages ([11676b6](#))

### 4.14 Code Refactoring

- **blueprints:** import dynamic way ([30ee0a0](#))
- **blueprints:** remove logging module from all blueprints ([a51709e](#))
- **db:** models available could be import from init module ([2361e0e](#))
- **db:** move user\_roles model to its own module ([650eb39](#))
- **exceptions:** add error handler to marshmallow validation error class ([10bb664](#))
- **exceptions:** correct error handler to marshmallow validation error class ([ba30805](#))
- **managers:** add new logic for managing database queries through database models ([758e077](#))
- **serializers:** correct user email validation ([2d733cf](#))
- **serializers:** move app.marshmallow\_schema.py to serializers package ([47f75e1](#))
- **serializers:** upgrade validation fields ([24ac198](#))
- **services:** add new logic for managing business logic to auth ([3c969b5](#))
- **services:** add new logic for managing business logic to documents ([1ce7b96](#))
- **services:** add new logic for managing business logic to roles ([7fff4c1](#))
- **services:** add new logic for managing business logic to tasks ([079741d](#))
- **services:** add new logic for managing business logic to users ([572f37f](#))
- **swagger:** move app.utils.swagger\_models to app.swagger package ([ef4dd87](#))
- **swagger:** update document swagger models ([7015c61](#))
- **swagger:** update role swagger models ([d618021](#))
- **swagger:** update user swagger models ([766e697](#))
- **tasks:** add suffix to task names ([998a56d](#))
- **utils:** create new modules to constants and request query operators ([cbf12c9](#))

#### 4.14.1 2.0.0 (2020-10-27)

### 4.15 BREAKING CHANGES

- order field in search requests is a list of dicts.

### 4.16 Features

- **factories**: add prevent code for checking if a given model is registered as factory (1605a01)
- **shell**: import Factory class to Flask interactive shell (8cf9c8e)

### 4.17 Code Refactoring

- replace cerberus to flask-mashmallow validation (7552d5c)
- **celery**: replace old Celery setting names with new ones (15e0c03)
- **celery**: update way to set FLASK\_CONFIG value on Flask command (a865548)

### 4.18 Build System

- add .versionrc that shows build/perf/refactor/revert (0017d66)
- add sphinx-click configuration to Sphinx and create new file for showing Click documentation (bb41b7b)
- add sphinx-click for showing Click documentation in Sphinx (c0a8f55)
- **pip**: remove cerberus package (4a4fe72)
- **pip**: split python packages in two requirements local and production (f39a2a5)

#### 4.18.1 1.4.1 (2020-10-07)

### 4.19 Bug Fixes

- **celery**: correct problem when start Celery (52ad2fb), closes #3

#### 4.19.1 1.4.0 (2020-10-04)

### 4.20 Features

- **celery**: add task for exporting several files (ca8355f)
- **documentation**: add sphinx integration (8c313fd)

#### 4.20.1 1.3.0 (2020-09-20)

### 4.21 Features

- **swagger:** add Swagger full integration (1eaf8d8)

#### 4.21.1 1.2.0 (2020-09-18)

### 4.22 BREAKING CHANGES

- install/update Node.js and Python libraries

### 4.23 build

- update Node.js and Python packages (b7416cc)

#### 4.23.1 1.1.0 (2020-05-31)

### 4.24 Features

- **security:** add role-based authorization (345b57e)
- add advanced search in documents, roles and users (8fce3e3)
- add marshmallow package integration (a8b647e)
- add Swagger integration (dc6ace4)

### 4.25 Refactor

- replace HTTP exceptions to Werkzeug HTTP Exceptions (31e5606)
- move Word and Excel celery tasks to them own modules (00e42e5)

### 4.26 Docs

- docs: add installation project guide (b915d31)

#### 4.26.1 1.0.0 (2020-05-17)

### 4.27 BREAKING CHANGES

- **pip:** update Python dependencies

### 4.28 Features

- **celery:** add basic installation (147dd2c)
- **db:** add peewee migrations (231696c)
- **documents:** add document logic (1eb7ec1)
- **emails:** add send emails after creation an user (7c2cf0e)
- **log:** add support for logrotate (09925e1)
- **users:** add created\_by column in user model (8a3d013)
- **users:** add Excel and PDF users export to background processes (781e091)
- **users:** add recovery password feature (e1e916e)

### 4.29 Build

- **pip:** update requirements.txt (6193153)

#### 4.29.1 0.8.0 (2020-04-29)

### 4.30 Features

- **roles:** add role logic (d7a0535)
- **security:** add jwt authentication (fb51089)
- **users:** add role model integration to user model (69bc124)
- **users:** add user.get endpoint (018b965)

#### 4.30.1 0.7.0 (2020-04-23)

### 4.31 Features

- **doc:** add standard-version NodeJS package (c1b2cb3)

### 4.31.1 0.6.1 (2020-04-23)

## 4.32 BREAKING CHANGES

- update python dependencies

## 4.33 Features

- **db:** added script for creating database tables ([c14b566](#))
- **logging:** added logging configuration ([297b9c3](#))
- **seeders:** added user seeder ([e78b4c4](#))
- **tests:** add tests and code coverage ([17317b7](#))
- **validation-requests:** add validation requests with cerberus ([a5beed6](#))

## 4.34 Bug Fixes

- **commitizen:** fixed problem with the process of commitizen tags ([1d3677d](#))
- **docs\_to\_pdf:** fixed problem about convert a docx file to a pdf file with uWSGI ([aabbc2d](#))
- **peewee:** fixed problem about a connection already opened error ([6279470](#))
- **peewee:** problem with database connection already opened ([e6c07c9](#))
- **users:** update user endpoint cannot update data ([9dfc4cc](#))
- request search fields in search users, export PDF and export Excel endpoints ([2ae7ab7](#))

## 4.35 Build

- update requirements.txt ([f783e78](#))
- update requirements.txt ([b6378ba](#))
